Solution Considerations

### **Concurrency Terminology** tavallinen ohjelma · Process, thread "Ordinary" program Sequential process, one thread of execution Concurrent program - Many sequential process, that may be executed in parallel · multi-threaded Java-program, runs in one system · Web-application, distributed on many systems • Multiprocessor system, parallel program Many sequential or concurrent processes are executed in parallel rinnakkaisohjelma, moniprosessori parallel rinnakkaisohjelma, moniprosessorisovellus Many architectures, no winner yet · Distributed system, distributed program No shared memory hajautettu ohjelma - Interconnected systems Copyright Teemu Kerola 2009

## The Multicore Challenge • We have a heat-barrier dead-end to develop simple to program single core chips - So, we leap to multicore chips in pursuit for ever higher processing power • Parallel Challenge: how to use these multicore computers efficiently to speed up computing? - Concurrent programming - We should have launched a parallel programming "Manhattan Project" a long time ago • Would need now 100's of millions (\$), not 10's of millions (\$) per year for long term funding David Patterson, The Multicore Challenge, The CCC Blog, Aug 26, 2008, 29.10.2009 Copyright Teemu Kerola 2009 6

### Concurrency at HW-level

- Machine language code
  - Many instructions at execution concurrently

Comp.Org. I, II (tito, tikra)

- Logically "one at a time" (von Neumann arch.)
  - · At least one "instruction cluster" at a time
- Program execution may stop/pause after any instruction
- · High level programming language code
  - Process switch can occur at any time
  - No "handle" on process switch times (in general)
    - Operating system & external events decide
  - Need to synchronize with other programs
  - Need to communicate with other programs
  - Need to get handle to process switch occurrences
  - Other processes may be in execution at the same time

### Problem Free Concurrency?

- · No problems at all?
  - Concurrent threads in execution
  - No shared data, no I/O (or private I/O)
  - No communication, no synchonization
- · No shared data, but data in shared memory
  - Bus congestion may be problem
    - Concurrency problem (bus use) solved in HW
    - · Slows down execution
- · Communication/synchronization is needed eventually
  - Combine results from concurrent threads

Copyright Teemu Kerola 2009

### Concurrency Problems

- · Keep data consistent
  - Update all fields of shared data
- Complete writing a buffer before reading starts
- Synchronize with someone
  - Complete writing before reading starts
  - Give money only after bank card is taken
  - Compile new Java class before execution resumes
  - Do not wait forever, if the other party is dead
- Communicate with someone
  - Send a short message to someone
  - Send data to be processed to someone
  - Send 2 GB data for remote processing, wait for result

## Concurrency Examples

- · Playstation 3
  - Use effectively 2 cells, 9 processors at each cell
    - · Use two different processor architectures
  - Divide-and-conquer or filtering approach?
- Desktop PC
  - Use effectively 4 processors and a graphics adapter to generate graphics for fast moving game
  - Divide processing for CPU's and graphics adapter?
  - Utilize all 4 processors
  - Control shared access to game data base
    - · In memory? In disk?
    - In a file server in Japan?

## Concurrency Examples

- · Multithreaded Java program on a multiprocessor system w.cs.helsinki.fi/u/kerola/rio/Java/examples/Pl
  - Access to shared data structures

vera: javac Plusminus1.java vera: time java Plusminus1

www.cs.helsinki.fi/u/kerola.

vera: javac Plusminus8.java vera: time java Plusminus8 >& a & vera: ps -eo pcpu,pid,user,args | sort -k 1 -r | head -10

vera has 8 processors visible to operating system

- Why is result different with extra output - Synchronization between threads
- · Displaying these slides from file server
  - Transfer slides to local buffer and display them

## Concurrency Examples

- · Linux Beowulf 6 node cluster
  - How to solve weather forecast Hirlam model as fast as possible?
  - How to best distribute data?
  - Solution scalable to 100 or 1000 nodes?
- Web server
  - How to serve 1000 or 10000 concurrent requests with 100 file servers
    - · Most reads, but some writes to same files?
    - · How to guarantee consistent reads with simultaneous writes?

### Concurrency Examples

- · Operating system
  - How to keep track of all concurrent processes, each with multiple threads?
  - What type of concurrency control utilities should be offered to user programs?
    - · Which utilities offered to OS services?
  - How do we guarantee that the system does not "freeze"
  - How to write an 8-disk disk controller device driver?
  - How do I guarantee, that nothing disturbs an ongoing process switch?

### Concurrency Problem Solution Level

- Processor level, i.e., below machine language level
  - HW solutions, automatic, no errors Need to understand, this is where it really happens
- Machine language level
  - Specific (HW) machine instructions for concurrency solutions
  - Clever solutions without specific instructions
- Need to be used properly, this is where it really happens
- Program level, i.e., programming language level
  - SW solutions, many possibilities for error
  - Solve problem by programming the solution your self

  - Very error prone Requires privileged execution mode (usually)
  - Solve problem directly by invoking certain available library services
    - Error prone may invoke wrong routines at wrong times
  - Solve problem by letting available library service do it all for you

    Not suitable always may not fit to your problem well

### Library Solutions for **Concurrency Problems**

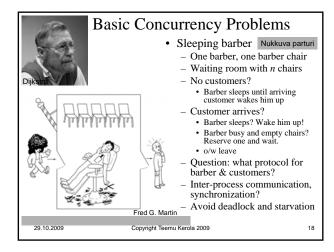

- Programming language run-time library
  - E.g., Java thread management
  - Usually within one process (in one system)
  - Any program can use
  - May be implemented directly or with OS-libraries
- Operating systems services (libraries)
  - Any process can use these, not so portable across OS's
  - Usually only choice between many processes
    - Exception: programming language library that implements its services with OS
  - Only choice between many systems
  - May need privileged execution mode
    - · Some services reserved only for OS programs or

### **Basic Concurrency Problem Types** Mutual exclusion, poissulkemisongelma Mutex Person id = idX One or more critical code Person.name = nameX; segments, i.e., critical section Person.age = ageX; At most one process executing critical section (of code) at any time I.e., at most one process holds this resource (code) at any time · Synchronization continue Communication Copyright Teemu Kerola 2009 29.10.2009

## Basic Concurrency Problems • Readers-writers - Shared data-base - Many can read same item concurrently - Only one can write at a time • Reading not allowed at that time - Readers have priority over writers - Question: protocol for readers/writers? - Mutual exclusion, synchronization - Avoid deadlock, starvation

# System Considerations Different threads in same process? Who controls thread switching? Application or OS? Different processes in same system? Shared memory or not? Many threads in each process? Different threads/processes in processors grid? No shared memory Different threads/processes in distributed system? No shared memory Large communication delays

### **Solution Considerations**

- Solution at application level without HW support
  - Do everything from scratch
- Solution at application level with HW support
  - Use special machine language level instructions or structures
- · Solution at operating system level
  - Use utilities in operating system library
- · Solution at programming language level
  - Use utilities in programming language library
- · Solution at network level
  - Use utilities in some network server
- Need to understand what really happens
