

Lesson 2

## Concurrency at Programming Language Level

Ch 2 [BenA 06]

Abstraction  
Pseudo-language  
BACI  
Ada, Java, etc.

16.10.2009 Copyright Teemu Kerola 2009 1

## Levels of Abstraction

- Granularity of operations
  - Invoke a library module
  - Statement in high level programming language
  - Instruction in machine language
- Atomic statement
  - Anything that we can guarantee to be atomic
    - Executed completely "at once"
    - Always the same correct atomic result
    - Result does not depend on anybody else
  - Can be at any granularity
  - Can *trust* on that atomicity

16.10.2009 Copyright Teemu Kerola 2009 2

## Atomic Statement

- Atomicity guaranteed somehow
  - Machine instruction: HW
    - Memory bus transaction
  - Programming language statement, set of statements, or set of machine instructions
    - SW
      - Manually coded
      - Disable interrupts
      - OS synchronization primitives
    - Library module
      - SW
        - Manually coded inside
        - Provided automatically to the user by programming environment

Load R1, Y  
 Read mem(0x35FA8300)  
 -- start atomic  
 Load R1, Y  
 Sub R1, =1  
 Jpos R1, Here  
 -- end atomic

Monitors  
 Ch 7 [BenA 06]

16.10.2009 Copyright Teemu Kerola 2009 3

## Concurrent Program

- Sequential process
  - Successive atomic statements
  - Control pointer (= program counter)
- Concurrent program
  - Finite set of sequential processes working for same goal
  - Arbitrary interleaving of atomic statements in different processes

3 processes (P, R, Q) interleaved execution

p3, ...  
 ↑ cp<sub>p</sub>  
 q2, ...  
 ↑ cp<sub>q</sub>  
 r2, ...  
 ↑ cp<sub>r</sub>

P: p1 → p2 → p3 → p4 ...  
 R: r1 → r2 → r3 ...  
 Q: q1 → q2 → q3 ...

P: p1 → p2    p1→q1→p2→q2  
 Q: q1 → q2    p1→q1→q2→p2  
 p1→p2→q1→q2  
 q1→p1→q2→p2  
 q1→p1→p2→q2  
 q1→q2→p1→p2  
 p1 → q2 → p2 → q1

16.10.2009 Copyright Teemu Kerola 2009 4

## Program State, Pseudo-language

- Sequential program
  - Algorithm 2.2: Trivial sequential program
- State
  - next statement to execute (cp, i.e., PC)
  - variable values

integer n ← 0  
 integer k1 ← 1  
 integer k2 ← 2  
 p1: n ← k1  
 p2: n ← k2

initial state: p1: n ← k1, k1 = 1, k2 = 2, n = 0  
 execute p1 → state: p2: n ← k2, k1 = 1, k2 = 2, n = 1  
 execute p2 → state: (end), k1 = 1, k2 = 2, n = 2

16.10.2009 Copyright Teemu Kerola 2009 5

## (Global) Program State

- Concurrent program
  - Algorithm 2.1: Trivial concurrent program
- Local state for each process
  - cp
  - Variable values
    - Local & global
- Global state for program
  - All cp's
  - All local variables
  - All global variables

integer n ← 0  
 integer k1 ← 1    integer k2 ← 2  
 p1: n ← k1    q1: n ← k2  
 e1: n ← k2

execute p1 → state: p1: (end), q1: n ← k2, k1 = 1, k2 = 2, n = 1  
 execute q1 → state: q1: (end), p1: n ← k1, k1 = 1, k2 = 2, n = 2  
 execute p1 → state: (end), (end), k1 = 1, k2 = 2, n = 0  
 execute q1 → state: (end), (end), k1 = 1, k2 = 2, n = 0

16.10.2009 Copyright Teemu Kerola 2009 6

### Possible Program States

- List of processes in program
  - List of values for each process
  - cp
  - value of each local/global/shared variable

$p1: n \leftarrow k1$   
 $q1: n \leftarrow k2$   
 $k1 = 1, k2 = 2$   
 $n = 0$

```

state: { { p1: n ← k1  - process p
          k1 = 1 }
        { q1: n ← k2  - process q
          k2 = 2 }
        n = 0        - shared variable
    }
    
```

- Nr of possible states can be (very) large
  - Not all states are reachable states!

unreachable state: { { p1: n ← k1  
 k1 = 2 }  
 { q1: n ← k2  
 k2 = 1 }  
 n = 3 }

16.10.2009 Copyright Teemu Kerola 2009 7

### State Diagram and Scenarios

State diagram

Process p	Process q	n	k1	k2
p1: n ← k1	q1: n ← k2	0	1	2
(end)	q1: n ← k2	1	1	2
(end)	(end)	2	1	2

Scenario 1 (left side)

- Transitions from one possible state to another
  - Executed statement must be one of those in the 1st state
- State diagram for concurrent program
  - Contains all reachable states and transitions
  - All possible executions are included, they are all correct!

16.10.2009 Copyright Teemu Kerola 2009 8

### Atomic Statements

Algorithm 2.1: Trivial concurrent program

```

integer n ← 0
p: integer k1 ← 1
q: integer k2 ← 2
p1: n ← k1
q1: n ← k2
    
```

- Two scenarios
  - Both correct
  - Different results
- NO need to have the same result! Statements do the same, but overall result may be different. (see p. 19 [BenA 06])
- Atomic?
  - Assignment
  - Boolean evaluation
  - Increment

16.10.2009 Copyright Teemu Kerola 2009 9

### Algorithm 2.3: Atomic assignment statements

```

integer n ← 0
p: n ← n + 1
q: n ← n + 1
    
```

- Two scenarios for execution
  - Both correct
  - Both have the same result

P first, and then Q			Q first, and then P		
Process p	Process q	n	Process p	Process q	n
p1: n ← n + 1	q1: n ← n + 1	0	p1: n ← n + 1	q1: n ← n + 1	0
(end)	q1: n ← n + 1	1	p1: n ← n + 1	(end)	1
(end)	(end)	2	(end)	(end)	2

16.10.2009 Copyright Teemu Kerola 2009 10

### Algorithm 2.3: Atomic assignment statements

```

integer n ← 0
p: n ← n + 1
q: n ← n + 1
    
```

Same statements with smaller atomic granularity:

### Algorithm 2.4: Assignment statements with one global reference

```

integer n ← 0
integer temp
p1: temp ← n
p2: n ← temp + 1
q1: temp ← n
q2: n ← temp + 1
    
```

16.10.2009 Copyright Teemu Kerola 2009 11

### Too Small Atomic Granularity

Algorithm 2.4: Assignment statements with one global reference

		integer n ← 0			
		p		q	
		integer temp	integer temp	integer temp	integer temp
		p1: temp ← n	q1: temp ← n	p2: n ← temp + 1	q2: n ← temp + 1
Scenario 1	OK	0	0	0	0
Scenario 2	Bad result	0	0	1	1

- Scenario 1 - OK
- Scenario 2 - Bad result
- From now on
  - Assignments and Boolean evaluations are atomic!

16.10.2009 Copyright Teemu Kerola 2009 12

### Correctness

- What is the correct answer?
- Usually clear for sequential programs
- Can be fuzzy for concurrent programs
  - Many correct answers?
  - What is intended semantics of the program?
  - Run programs 100 times, each time get different answer?
    - Each answer is correct, if program is correct!
    - Does not make debugging easier!
    - Usually can not test all possible scenarios (too many!)
  - How to define correctness for concurrent programs?
    - Safety properties = properties that are always true
    - Liveness properties = properties that eventually become true

"turvallisuus" "elävyyss"

16.10.2009 Copyright Teemu Kerola 2009 13

### Safety and Liveness

- Safety property safety-ominaisuus, turvallisuus
  - property must be true all the time
    - "Identity" identiteetti, invariantti
      - memFree + memAllocated = memTotal
    - Mouse cursor is displayed
    - System responds to new commands
- Liveness property elävyyss, liveness-ominaisuus
  - Property must eventually become true
    - Variable n value = 2
    - System prompt for next command is shown
    - Control will resume to calling program
    - Philosopher will get his turn to eat
    - Eventually the mouse cursor is not displayed
    - Program will terminate
- Duality of safety and liveness properties
  - { P<sub>i</sub> will get his turn to eat } ≡ not { P<sub>i</sub> will never get his turn to eat }
  - { n value will become 2 } ≡ not { n value is always ≠ 2 }

16.10.2009 Copyright Teemu Kerola 2009 14

### Linear Temporal Logic (LTL)

(lineaarinen) temporaalilogiikka

- Define safety and liveness properties for certain state in some (arbitrary) scenario
  - Example of Modal Temporal Logic (MDL), logic on concepts like possibility, impossibility, and necessity
- Alternative: Branching Temporal Logic (BTL)
  - Properties true in some or all states starting from the given state
    - More complex, because all future states must be covered
  - Common Temporal Logic (CTL)
    - Can be checked automatically
      - Every time computation reaches given state
    - SMV model checker
    - NuSMV model checker

16.10.2009 Copyright Teemu Kerola 2009 15

### Fairness

reilius

- (Weakly) fair scenario
  - Wanted condition eventually occurs
    - Nobody is locked out forever
    - Will a philosopher ever get his turn to eat?
    - Will an algorithm eventually stop?

Algorithm 2.5: Stop the loop A	
integer n ← 0	
boolean flag ← false	
p	q
p1: while flag = false	q1: flag ← true
p2: n ← 1 - n	q2:

- All scenarios should be fair
  - One requirement in correct solution

16.10.2009 Copyright Teemu Kerola 2009 16

### Machine Language Code

- What is atomic and what is not?
  - Assignment? X = Y;
  - Increment? X = X+1;

Algorithm 2.6: Assignment statement for a register machine	
integer n ← 0	
p	q
p1: load R1,n	q1: load R1,n
p2: add R1,#1	q2: add R1,#1
p3: store R1,n	q3: store R1,n

16.10.2009 Copyright Teemu Kerola 2009 17

### Critical Reference

kriittinen viite

- Reference to variable v is critical reference, if ...
  - Assigned value in P and read in Q
    - Read directly or in a statement
- Program satisfies limited-critical-reference (LCR)
  - Each statement has at most one critical reference rajoitettu kriittinen viite
  - Easier to analyze than without this property
  - Each program is easy to transform into similar program with LCR

	P	Q	
Not LCR:	n = n+1;	n = n+1	Bad
Not LCR:	n = m+1;	m = n+1	Bad
LCR:	tempP = n+1; n = tempP;	tempQ = n+1; n = tempQ;	Good

LCR vs. atomicity? (ouch)

16.10.2009 Copyright Teemu Kerola 2009 18

### Volatile and non-atomic variables

- Volatile variable riskialtis
  - Can be modified by many processes (must be in shared memory)
  - Advice for compiler (pragma)
    - Keep something in memory, not in register
    - Pseudocode – does not generate code
- Non-atomic variables
  - Multiword data structures: long ints, arrays, records, ...
  - Force access to be indivisible in given order

What if compiler/hw decides to keep value of n in a register/cache? When is it stored back to memory? What if local1 & local2 were volatile?

**Algorithm 2.8: Volatile variables**

integer n ← 0		integer local	
p	q	p	q
integer local1, local2		integer local	
p1: n ← some expression		q1: local ← n + 6	
p2: computation not using n		q2: local ← n + 6	
p3: local1 ← (n + 5) * 7		q3: local ← n + 6	
p4: local2 ← n + 5		q4: local ← n + 6	
p5: n ← local1 * local2		q5: local ← n + 6	

19

### Example Program with Volatile Variables

**Algorithm 2.9: Concurrent counting algorithm**

integer n ← 0	
p	q
integer temp	integer temp
p1: do 10 times	q1: do 10 times
p2: temp ← n	q2: temp ← n
p3: n ← temp + 1	q3: n ← temp + 1

- Can implement it in any concurrent programming language
  - (Extended) Pascal and (Extended) C
  - BACI (Ben-Ari Concurrency Interpreter)
    - Code automatically compiled (from Extended Pascal or C)
  - Ada
  - Java

16.10.2009

Copyright Teemu Kerola 2009

20

### Concurrent Program in Pascal

```

1 program count;
2 var n: integer := 0;
3
4 procedure p;
5 var temp, i: integer;
6 begin
7   for i := 1 to 10 do
8     begin
9       temp := n;
10      n := temp + 1;
11    end;
12 end;
13
14 procedure q;
15 var temp, i: integer;
16 begin
17   for i := 1 to 10 do
18     begin
19       temp := n;
20       n := temp + 1;
21     end;
22 end;
23
24 begin { main program }
25   cobegin p; q coend;
26   writeln('The value of n is ', n);
27 end.
    
```

21

16.10.2009

Copyright Teemu Kerola 2009

### Concurrent Program in C

```

1 int n = 0;
2
3 void p() {
4   int temp, i;
5   for (i = 0; i < 10; i++) {
6     temp = n;
7     n = temp + 1;
8   }
9 }
10
11 void q() {
12   int temp, i;
13   for (i = 0; i < 10; i++) {
14     temp = n;
15     n = temp + 1;
16   }
17 }
18
19 void main() {
20   cobegin { p(); q(); }
21   cout << "The value of n is " << n << "\n";
22 }
    
```

22

What if compiler optimized and kept n in a register? Lets hope not! (in ExtPascal or C-- global (volatile) variables are seemingly kept in memory by default)

16.10.2009

Copyright Teemu Kerola 2009

### Concurrent Program in Ada

```

1 with Ada.Text_IO; use Ada.Text_IO;
2 procedure Count is
3   N: Integer := 0;
4   pragma Volatile(N);
5
6   task type Count_Task;
7   task body Count_Task is
8     Temp: Integer;
9   begin
10    for I in 1..10 loop
11      Temp := N;
12      N := Temp + 1;
13    end loop;
14  end Count_Task;
15
16 begin
17   declare
18     P, Q: Count_Task;
19   begin
20     null;
21   end;
22   Put_Line("The value of N is " & Integer'Image(N));
23 end Count;
    
```

23

16.10.2009

Copyright Teemu Kerola 2009

### Concurrent Program in Java

```

1 class Count extends Thread {
2   static volatile int n = 0;
3
4   public void run() {
5     int temp;
6     for (int i = 0; i < 10; i++) {
7       temp = n;
8       n = temp + 1;
9     }
10  }
11
12   public static void main(String[] args) {
13     Count p = new Count();
14     Count q = new Count();
15     p.start();
16     q.start();
17
18     try {
19       p.join();
20       q.join();
21     } catch (InterruptedException e) {}
22     System.out.println("The value of n is " + n);
23 }
    
```

24

16.10.2009

Copyright Teemu Kerola 2009

### BACI [http://www.mines.edu/fs\\_home/tcamp/baci/](http://www.mines.edu/fs_home/tcamp/baci/)

- Ben-Ari Concurrency Interpreter
  - Write concurrent programs with
    - C-- or Ben-Ari Concurrent Pascal (.cm and .pm suffixes)
    - Compile and run in BACI
  - GUI for Unix/Linux
- jBACI <http://stwww.weizmann.ac.il/g-cs/benari/jbaci/>
  - Just like BACI
  - GUI for Windows
- Installation <http://stwww.weizmann.ac.il/g-cs/benari/jbaci/baci1-4-5.zip>
  - load version 1.4.5 jBACI executable files and example programs, unzip, edit config.cfg to have correct paths to bin/bacc.exe and bin/bapas.exe translators, click run.bat
- Use in class, homeworks and in project

16.10.2009 Copyright Teemu Kerola 2009 25

### BACI Overall Structure

```

    add.cm (C-- (Concurrent C))
    ...
    void main() {
    ...
    cobegin { add10();
    ...
    add10(); }
    ...
    }

    bacc.exe (C-- to PCODE Compiler)
    ...
    add.lst
    ...
    17 24 void main() {
    ...
    18 25 cobegin {add10(); add10();}
    ...
    }

    add.pco (PCODE)
    ...
    LOAD_ADDR, push sum
    LOAD_VALUE, push local
    PUSH_LITERAL 1
    DO_ADD, pop(1), s[t]=s[oldest-1]+s[oldest]
    STORE, s[s[t]-1]=s[t], pop(2)
    ...
    }

    PCODE Interpreter (bainterp.exe)
    ...
    Executing PCODE ...
    C n=1 i=A n=1 C2 i=
    1 A
    C n=4 i=2 C
    B n=A n=5 i=24 A
    
```

<http://www.cs.helsinki.fi/u/kerola/rio/BACI/baci-c.pdf>

16.10.2009 Copyright Teemu Kerola 2009 26

### jBACI

Just like BACI, but with Java

- requires Java v. 1.4 (SDK or JRE)
- Built-in compiler and interpreter
- edit state
- run state

```

    1 /*
    2 Add 10 to a variable in each of two processes.
    3 The answer can be between 2 and 20.
    4 Local variable enables bad scenario with source-level interleaving.
    5 */
    6 int sum = 0;
    7
    8 void add10() {
    9     int i;
    10    int local;
    11    for (i = 1; i <= 10; i++) {
    12        local = sum;
    13        sum = local + 1;
    14    }
    15 }
    16
    17 void main() {
    18     cobegin {
    19         add10();
    20         add10();
    21     }
    22     cout << "Sum = " << sum << endl;
    23 }
    24
    
```

<http://www.cs.helsinki.fi/u/kerola/rio/BACI/jbaci.pdf>

16.10.2009 Copyright Teemu Kerola 2009 27

### jBACI IDE (integrated development environment)

The screenshot shows the jBACI IDE interface with several panes:
 

- Process 0 main:** Shows the source code of the main function.
- Process 1 add10:** Shows the source code of the add10 function.
- Process 2 add10:** Shows the source code of another add10 function.
- Console:** Displays the output of the program, showing the final sum.
- Variables:** Shows the state of variables for each process, including local and global variables.
- Process Monitor:** Shows the status of each process (Active, Suspended, etc.).

### jBACI IDE (integrated development environment)

Annotations in the screenshot highlight:
 

- Process Monitor:** A window showing the state of processes.
- Source Editor:** The main window for editing source code.
- PCODE Editor:** A window for editing the generated PCODE.
- Console:** The output window.
- Variables:** A window showing the current state of variables.
- History:** A window showing the history of recent instructions.

### Summary

- Abstraction, atomicity
- Concurrent program, program state
- Pseudo-language algorithms
- High level language algorithms
- BACI

16.10.2009 Copyright Teemu Kerola 2009 30
