1

Computer Function

- von Neumann architecture

- memory contains both instruction and data

- Fetch-Execute Cycle

Figs 3.3, 3.9

(käslyn nouto ja suoritus sykli)

2

I/O control

- CPU executes instructions and with those instructions guides I/O modules
 - control and data registers in I/O modules
 - I/O modules give feedback to CPU with control and data registers, but only when CPU is reading them!

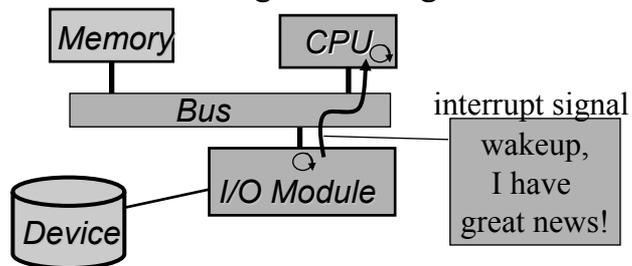

9/18/2003

Copyright Teemu Kerola 2003

3

I/O Control

- Interrupts allow I/O modules to give feedback to CPU even when CPU is doing something else

- DMA allows I/O modules to access memory without CPU's help

4

von Neumann Bottleneck

(von Neumann
pullonkaula)

- All components communicate via system bus
- Each component has its own inputs/outputs

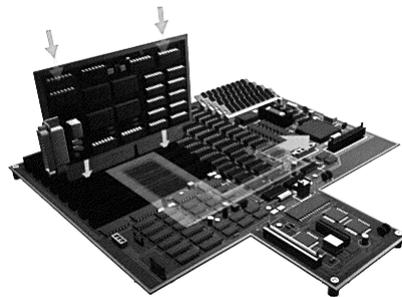

Fig. 3.15

– System bus must support them all

Fig. 3.16

System Bus

- 50-100 lines
(wires)
 - address
 - data
 - control
 - other: power, ground, clock
- Performance
 - bandwidth,
how many bits per sec?
 - propagation delay?

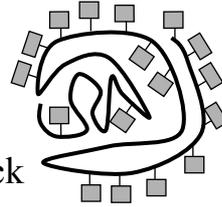

(väyläkapasiteetti)

(päästä päähän viive)

Bus Configurations

- One bus alone
 - might be very long
 - large end-to-end signal time
 - serious von Neumann bottleneck
 - all devices use similar speeds
 - slowest device determines speed used
- Hierarchy of buses
 - can maximize speed for limited access
 - closer to CPU
 - lower speed general access I/O
 - further away from CPU

Bus Design Features (3)

- Bus type
 - dedicated
 - address wires and data wires
 - multiplexed
 - address & data on same wires
- Arbitration method
 - centralised, distributed
 - bus controller, arbiter
- Timing
 - synchronous
 - asynchronous

(aikavuorottelu)

(vuoronvalinta)

(keskitetty, hajautettu)

(vuoronantaja)

(asynkrooninen,
epäsynkrooninen)

10

Synchronous timing

- All same speed devices
- All synchronized with a clock signal
- Slowest device determines speed
- Can make assumptions on when some other device will do something, or how fast it will do it
 - *"Do this in next cycle!"*
 - 1 or 2 clock cycles to do it?
 - data will be ready to read in 1 cycle (Fig. 3.19)
 - written data stored in 1 cycle (Fig. 3.19 (a) [Stal99])

How to read timing diagrams: (Fig. 3.27) (Fig. 3.26 [Stal99])

Asynchronous timing

- No need to have same speed devices
- Timing determined with change of signal levels
 - signaling may happen only at predetermined times
- Synchronize with signals (wires) *"Do this in when you can, please. Let me know, when you are done"*
 - "read", "write", "ack", ...
- Speed determined by devices in action
 - not by all devices that are or could be connected!
- Can **not** make assumptions on when some other device will do something

(Fig. 3.20) (Fig. 3.19 (b) [Stal99])

Bus Design Features (cont)

- Bus width
 - address, data
- Data transfer types
 - read, write
 - multiplexed & non-multiplexed operations
 - read-modify-write
 - E.g., for indivisible increments (concurrency control method for multiprocessor environments)
 - read-after-write
 - E.g., for check that write succeeds (multiproc. env.)
 - block
 - long delay for interrupt handling?

Fig. 3.21

(Fig. 3.20 [Stal99])

Example Bus: Industry Standard Architecture (ISA, or PC-AT)

- Bus type: dedicated
- Arbitration method: single bus master
- Timing: asynchronous
 - own 8.33 MHz clock,
 - 15.9 MBps max data rate, 5.3 MBps in practice
- Bus width: address 32, data 16
- Data transfer type
 - read, write, read block, write block

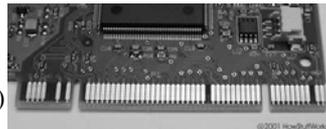

Example: Peripheral Component Interconnect (PCI) Bus

- Bus type: multiplexed
- Arbitration method: centralised arbiter
- Timing: synchronous, own 33 MHz clock
 - 2.122 Gbps (265 MBps) max data rate
- Bus width: address/data 32 (64), signal 17
- Data transfer type
 - read, write, read block, write block
- Max 16 slots (devices)

PCI Configurations

- Hierarchy Fig. 3.22 (Fig. 3.21 [Stal99])
- Bridge to internal/system bus allows them to be faster (with different bus protocol)
- Bridge to expansion buses allows them to be slower (with different bus protocol)

PCI card: 49 Mandatory Signals ⁽⁶⁾

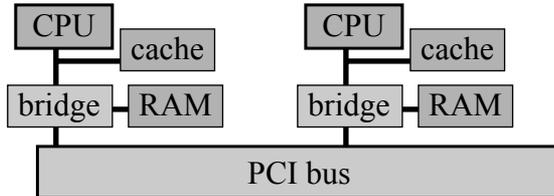

- 32 pins for address/data, time multiplexed
 - 1 parity pin
- 4 pins for command type/byte enable
 - E.g., 0110/1111 = memory read/all 4 bytes
- 2 system pins: clock, reset
- 6 transaction timing & coordination pins
- 2 arbitration pins (not shared with other devices!) to PCI bus arbiter: REQ, GNT
- 2 error pins: parity, system

PCI Bus

51 Optional Signals ⁽⁴⁾

- Request interrupt pins (4 pins for each dev)
- Cache support pins (2) for snoopy cache protocols

- 32 pins for additional multiplexed address/data
 - plus 7 control/parity pins
- 5 test pins
- 1 pin for locking the bus for multiple transactions
- (may have extra pin to select 66/33 MHz clock)

PCI Bus Transaction ⁽⁴⁾

- Bus activity is in separate *transactions*
- Each transaction preceded by *arbitration*
 - Fig. 3.24 (Fig. 3.23 [Stal99])
 - central arbiter (e.g., First-In-First-Out)
 - determines initiator/master for transaction
- Transaction is executed
- Bus is marked “ready” for next transaction

PCI Transaction Types ⁽⁵⁾

- Interrupt Acknowledge
 - READ interrupt parameter (e.g., subtype) for interrupt handler
- Special Cycle
 - broadcast message to many targets
- Configuration Read/Write
 - Read/Update (Write) device configuration data
- Dual Address Cycle
 - use 64 bit addresses in this transaction
- I/O or memory read/write
 - one or multiple words, cache line

22

Arbitration: A and B want bus

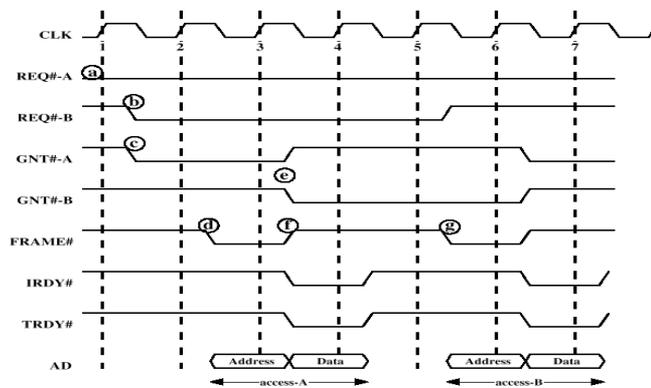

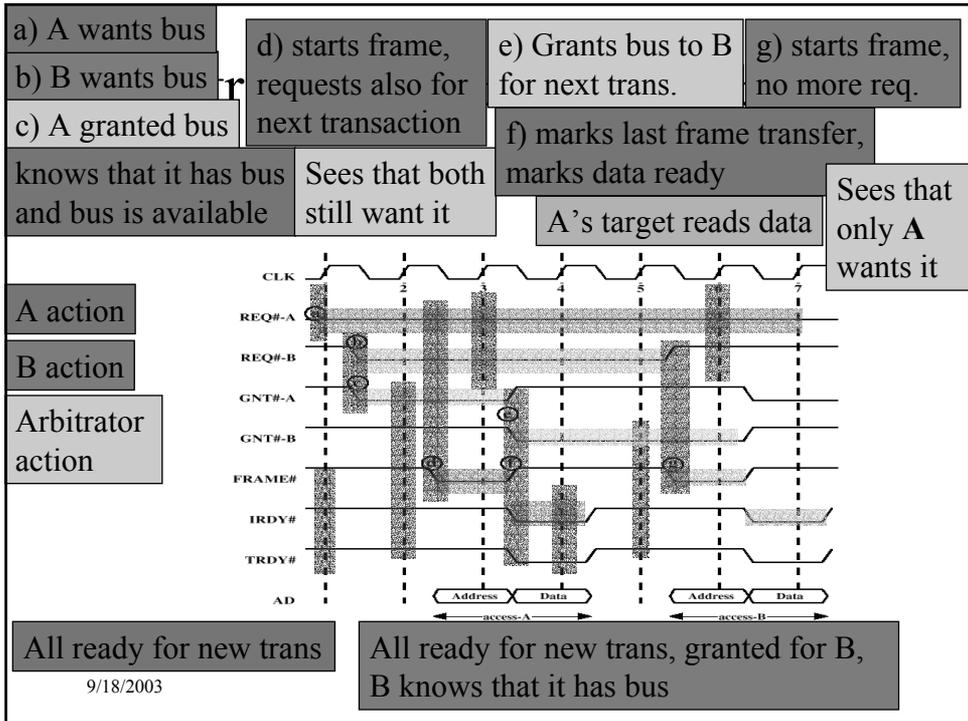

Fig. 3.25

Mostly just arbitration signals shown here (Fig. 3.24 [Stal99])

PCI Express

New Bus to Replace PCI

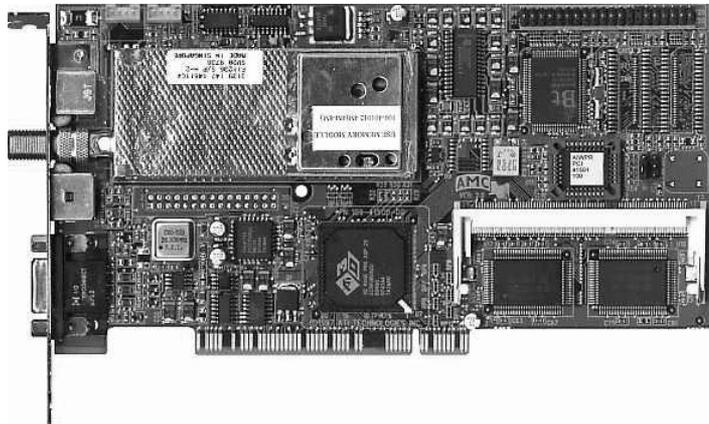

- Code name "Arapahoe" or 3GIO
- Prevent bus bottleneck between fast CPU and memory of the future
- Arapahoe Work Group <http://www.pcisig.com>
 - Compaq, Dell, IBM, Intel, Microsoft,
- Will replace PCI as industry standard
 - late 2003? low-end 2004? high-end 2005?
- PCI devices will work with PCI Express
- Speedup (E.g.) 64x as compared to std PCI
 - 16 GB/s with 32 lanes vs. 264 MB/s
- Scalable capacity per device (pin count, speed)
