RISC Architecture
Ch 13

Some History

Instruction Usage Characteristics

Large Register Files

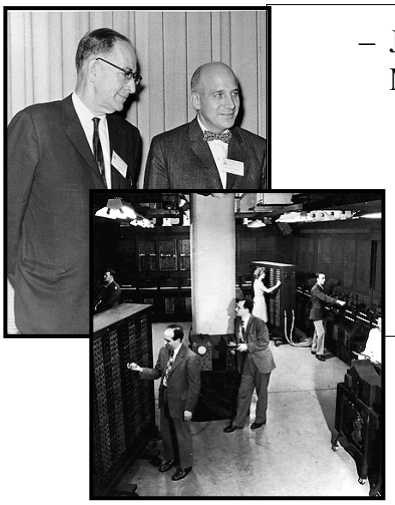
Register Allocation Optimization

RISC vs. CISC

Major Inventions in Computer Architecture: General purpose computer

- Howard Aiken, Mark I, 1944
  - relays, 17m long, 2.4m tall
  - 500 miles of wire, 5 tons
  - 3 million connections
  - 6 sec mult, 12 sec div
  - IBM ASCC (automatic sequence controlled calculator)
  - turned off last time 1959

ENIAC



- J. P. Eckert and John Mauchly, 1946
  - 1500 relays
  - 18000 vacuum tubes
  - 70,000 resistors
  - 20 accumulators
  - 10 digits
  - modify program by rewiring

Stored Program Computer

- Store both program and data in memory
- John von Neumann, 1945
  - Electronic Discrete Variable Automatic Computer (EDVAC) prototype
- Maurice Wilkes, 1949
  - Electronic Delay Storage Automatic Calculator (EDSAC)
  - first fully operational stored program computer
- Software was born

Floating Point hardware

Gene Amdahl, 1953

IBM 704

- OS allowed for batch processing
  - combine existing commands into new commands
- 5 kFLOPS
- 19 units produced

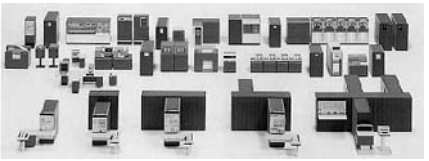
Family of computers

- Family of computers with different implementations of the same architecture
  - Computer system can grow within the family and all SW will still run
  - Need faster/bigger
    $\Rightarrow$ buy a faster/bigger system in the family
  - Gene Amdahl
  - IBM S/360
  - DEC PDP-8

1964

Microprogrammed control unit

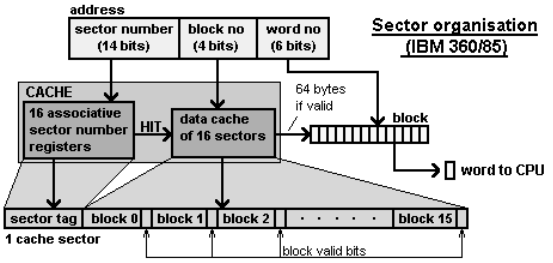
- Can modify instruction set architecture (ISA) easily
- Makes it easier to implement families of systems
- Can have different instruction set architecture (ISA) on top of the same HW
- Maurice Wilkes, 1951
- IBM System/360, 1964



Cache memory

- Maurice Wilkes, 1965
- major speed up (12x ?)
- IBM System/360 Model 85

1968



Virtual memory

- Tom Kilburn, 1962
- Atlas, 1962
  - 20 bits for virtual address space
  - 512 word (each 48 bits) page
  - 16 KB main mem
  - 2 units sold

Atlas accumulator cabinet

Pipelining

- Tom Kilburn (?)
- Atlas, 1962
  - 2 ALU's
  - overlap execution of 3 instructions

Atlas Main and B-Arithmetic Units

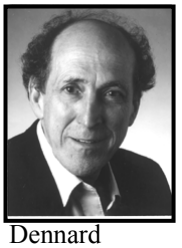
Multiple processors

- J. P. Eckert and John Mauchly
- Sperry Rand Univac 1108II (1108A), 1964
  - 3 CPU's
  - 2 I/O controllers
    - DMA
  - 36 bit words
  - test-and-set instruction was added for synchronization between processors

Mauchly & Univac console

RAM

- Static RAM
  - Fairchild 4100, 1970
    - 256 bits
- Dynamic Random Access Memory
  - Robert Dennard, IBM, 1966
  - Intel 1103, 1970
    - John Reed
    - 1024 bits
    - replaces magnetic core memory by 1972



Dennard

Reed

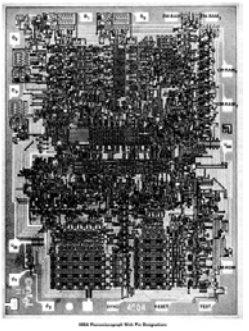
Single chip Microprocessor

- Hoff, Faggin, Mazor
- Intel 4004, 1971
  - 2300 transistors, 60K OPS
  - ”single chip which implements and interprets all microinstructions”
  - 4 bit words, 16 GPRs, 4-bit accumulator, operation register, instruction decoder
  - good for BCD operations (BCD = Binary Coded Decimal)
  - Japanese Busicom abandoned failed (!) project and bankrupted next year
  - Used in Pioneer 10 spacecraft, 1972

Hoff

Faggin

Mazor

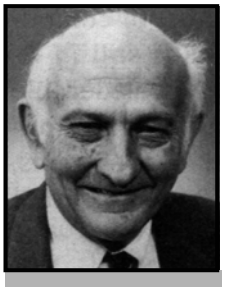


Vector processors

- Operate on entire vectors with one instruction
- Texas Instrument Advanced Scientific Computer (ASC), 1971
  - W. Joe Watson
  - 4 pipelines
  - vectors stored in memory
  - 7 machines built
  - vectorizing Fortran compiler
  - theoretical max speed 50 MFLOPS
  - slow scalar unit

RISC (2)

- Reduced Instruction Set Computer (RISC)
  - John Cocke, 1974
  - IBM 801 (prototype), 1974
  - project cancelled because instruction set not compatible with OS/360



- Try again … and succeed
  - Hennessy (1981) & Patterson (1980)
  - Proved, that even CISC machines may work faster if only simple instructions and addressing modes are used

Superscalar Processor

- ACS-1, J. Cocke, IBM Advanced Computer Systems, 1965 – cancelled as not S/360 compatible
- Complete more than one instruction per cycle
- Targeted to normal, scalar instructions to speed up scalar processing (as opposed to vector processing)
- IBM 801 (proto design 1974), RS/6000 (1989)
- Intel i960CA (1989), Pentium (1993)
- MIPS 10000 (1995)

Simultaneous Multithreading (SMT)

- One physical processor implements many logical processors
  - CDC 6600 I/O processor, J. Thornton, CDC, 1970
  - Susan Eggers & Hank Levy, U of Washington, 1995
- Operating systems sees many processors
- One CPU, separate register set for each logical processor
- Use memory wait stages (E.g., cache miss latencies) to run other threads (processes)
- Compaq Alpha EV-8, 4 SMT's (design 1999, dead 2001)
  - work continues at Intel for Itanium-II (2004?)
- Hyperthreads, Intel, 2001
  - Pentium 4 HT, new desktops at CS dept, late 2003 (2 hyperthreads with some 30% speedup)

Fast Cross-platform Emulation

- Cross-platform emulation could be made faster/use less energy than direct execution
  - Edmund J. Kelly, Malcolm John Wing & Robert Cmelik, Transmeta Corp., 1996
  - Can optimize and dynamically rebuild code (translation & code optimization)
    - lots of work, possibly big gains
    - E.g., emulators for other architectures (x86)
    - do (part of) pipeline optimization by (JIT) compiler, not dynamically by complex & large HW
  - Crusoe processor, 2000
