1

## Computer Function

- von Neumann architecture

– memory contains  
both instruction  
and data

- Fetch-Execute Cycle

(käskyn nouto ja  
suoritus sykli)

Figs 3.3, 3.9

9/4/2002

2

## I/O control

- CPU executes instructions and with those instructions guides I/O modules
  - control and data registers in I/O modules
  - I/O modules give feedback to CPU with control and data registers, but only when CPU is reading them!

9/4/2002

Copyright Teemu Kerola 2002

3

## I/O Control

- Interrupts allow I/O modules to give feedback to CPU even when CPU is doing something else

- DMA allows I/O modules to access memory without CPU's help

4

## von Neumann Bottleneck

- All components communicate via system bus
- Each component has its own inputs/outputs

Fig. 3.15

– System bus must support them all

Fig. 3.16

9/4/2002

5

## System Bus

- 50-100 lines (wires)
  - address
  - data
  - control
  - other: power, ground, clock
- Performance
  - bandwidth, how many bits per sec?
  - propagation delay?

(väyläkapasiteetti)

(päästä päähän viive)

6

## Bus Configurations

- One bus alone
  - might be very long
    - large end-to-end signal time
  - serious von Neumann bottleneck
  - all devices use similar speeds
  - slowest device determines speed used
- Hierarchy of buses
  - can maximize speed for limited access
    - closer to CPU
  - lower speed general access I/O
    - further away from CPU

8

## Bus Design Features <sup>(3)</sup>

- **Bus type**
  - dedicated, multiplexed (aikavuorottelu)
- **Arbitration method**
  - centralised, distributed (vuoronvalinta)
  - bus controller, arbiter (keskitetty, hajautettu)
  - (vuoronantaja)
- **Timing**
  - synchronous
  - asynchronous (asynkrooninen, epäsynkrooninen)

9/4/2002 Copyright Teemu Kerola 2002 10

## Synchronous timing

- All same speed devices
- All synchronized with a clock signal
- Slowest device determines speed
- Can make assumptions on when some other device will do something, or how fast it will do it

– 1 or 2 clock cycles to do it?

Fig. 3.19

(Fig. 3.19 (a) [Stal99])

9/4/2002

Copyright Teemu Kerola 2002

11

## Asynchronous timing

- No need to have same speed devices
- No synchronizing clock signal
- Timing determined only with change of signal levels
- Synchronize with signals (wires)
  - "read", "write", "ack", ...
- Speed determined by devices in action
- Can *not* make assumptions on when some other device will do something, or how fast it will do it

Fig. 3.20

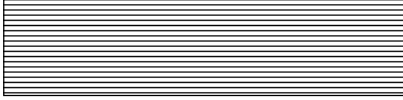

(Fig. 3.19 (b) [Stal99])

12

## Bus Design Features (cont)

- Bus width
  - address, data 
- Data transfer types
  - read, write Fig. 3.21 (Fig. 3.20 [Stal99])
  - multiplexed & non-multiplexed operations
  - read-modify-write
    - E.g., for indivisible increments (multiproc. env.)
  - read-after-write
    - E.g., for check that write succeeds (multiproc. env.)
  - block
    - long delay for interrupt handling?

9/4/2002

13

## Example Bus: Industry Standard Architecture (ISA, or PC-AT)

- Bus type: dedicated
- Arbitration method: single bus master
- Timing: asynchronous
  - own 8.33 MHz clock,
  - 15.9 MBps max data rate, 5.3 MBps in practice
- Bus width: address 32, data 16
- Data transfer type
  - read, write, read block, write block

9/4/2002

Copyright Teemu Kerola 2002

14

9/4/2002

Copyright Teemu Kerola 2002

15

## Example: Peripheral Component Interconnect (PCI) Bus

- Bus type: multiplexed
- Arbitration method: centralised arbiter
- Timing: synchronous, own 33 MHz clock
  - 2.122 Gbps (265 MBps) max data rate
- Bus width: address/data 32 (64), signal 17
- Data transfer type
  - read, write, read block, write block
- max 16 slots (devices)

9/4/2002

Copyright Teemu Kerola 2002

16

## PCI Configurations

- Hierarchy Fig. 3.22 (Fig. 3.21 [Stal99])
- Bridge to internal/system bus allows them to be faster (with different bus protocol)
- Bridge to expansion buses allows them to be slower (with different bus protocol)

9/4/2002

Copyright Teemu Kerola 2002

17

## PCI card: 49 Mandatory Signals <sup>(6)</sup>

- 32 pins for address/data, time multiplexed
  - 1 parity pin
- 4 pins for command type/byte enable
  - E.g., 0110/1111 = memory read/all 4 bytes
- System pins (2): clock, reset
- Transaction timing & coordination pins (6)
- Arbitration pins (2 for each device) to PCI bus arbiter: REQ, GNT
- Error pins (2): parity, system

9/4/2002

Copyright Teemu Kerola 2002

18

## PCI Bus

### 41 Optional Signals <sup>(4)</sup>

- Request interrupt pins (4 pins for each dev)
- Cache support pins (2) for snoopy cache protocols

- 32 pins for additional multiplexed address/data
  - plus 7 control/parity pins
- 5 test pins

9/4/2002

Copyright Teemu Kerola 2002

19

## PCI Bus Transaction <sup>(4)</sup>

- Bus activity is in separate transactions
- Each transaction preceded by arbitration

Fig. 3.24

(Fig. 3.23 [Stal99])

- central arbiter (e.g., First-In-First-Out)
- determines initiator/master for transaction
- Transaction is executed
- Bus is marked “ready” for next transaction

9/4/2002

Copyright Teemu Kerola 2002

20

## PCI Transaction Types <sup>(5)</sup>

- Interrupt Acknowledge
  - READ interrupt parameter (e.g., subtype) for interrupt handler
- Special Cycle
  - broadcast message to many targets
- Configuration Read/Write
  - Read/Update (Write) device configuration data
- Dual Address Cycle
  - use 64 bit addresses in this transaction
- I/O or memory read/write (line, multiple)

9/4/2002

Copyright Teemu Kerola 2002

21

## PCI Read Transaction (no anim)

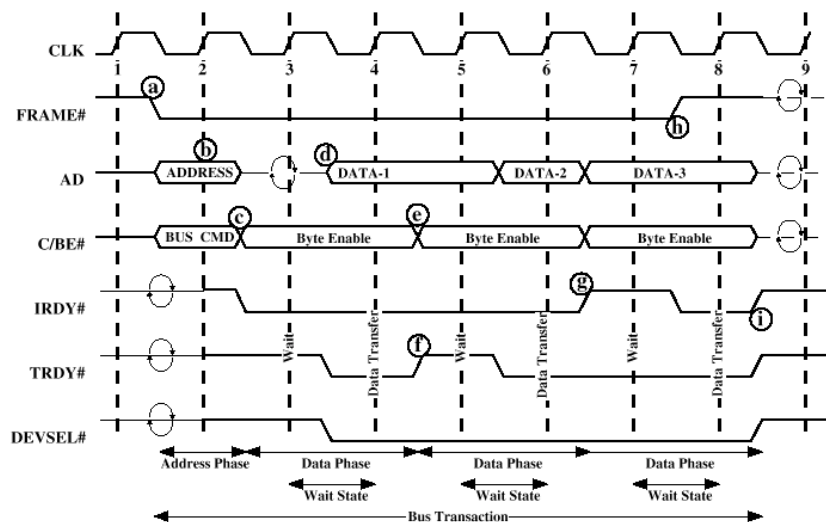

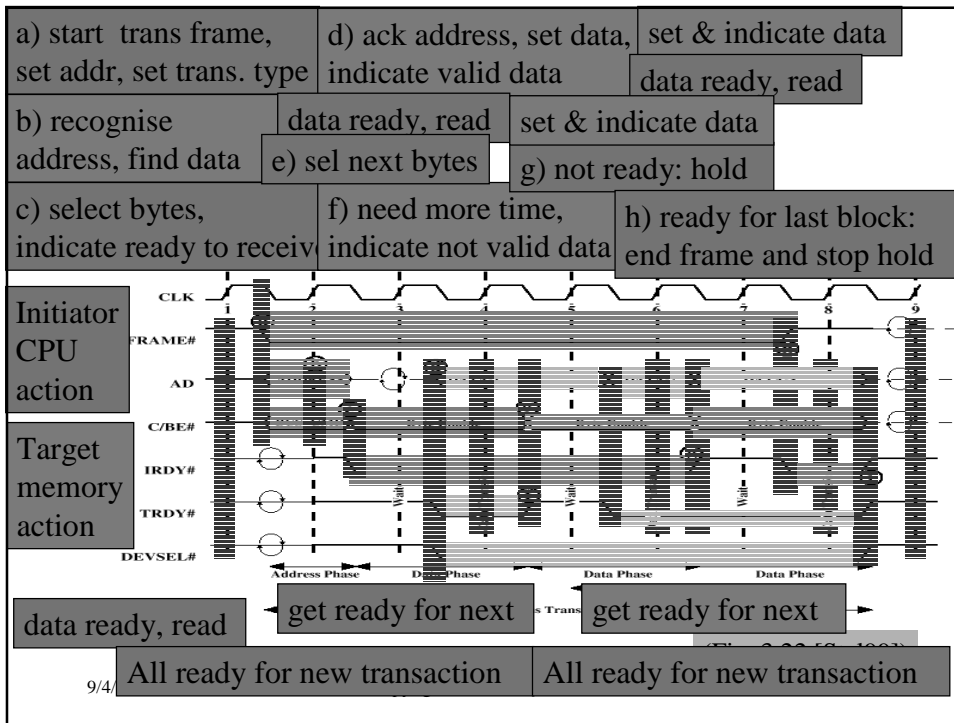

Fig. 3.23 (Fig. 3.22 [Stal99])

22

### Arbitration: A and B want bus

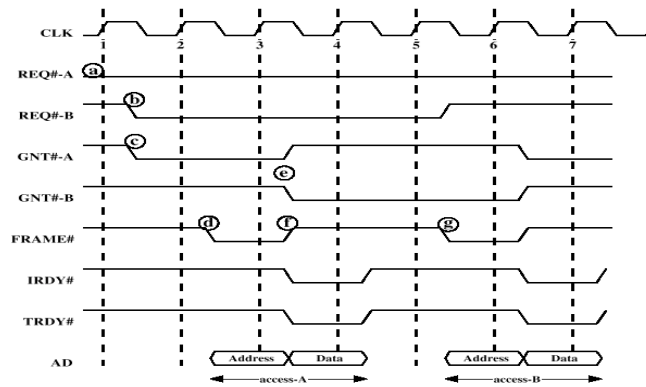

Fig. 3.25

Mostly just arbitration signals shown here (Fig. 3.24 [Stal99])

## PCI Express: New Bus to Replace PCI

- Code name "Arapahoe" or 3GIO
- Prevent bus bottleneck between fast CPU and memory of the future
- Arapahoe Work Group <http://www.pcisig.com>
  - Compaq, Dell, IBM, Intel and Microsoft
- Will replace PCI as industry standard
  - late 2003? low-end 2004? high-end 2005?
- PCI devices will work with PCI Express
- Speedup 30x as compared to std PCI
  - at least 8 GB/s vs. 264 MB/s
- Scalable capacity per device (pin count, speed)

9/4/2002
