

**Table 6.1 Summary of Deadlock Detection, Prevention, and Avoidance  
Approaches for Operating Systems [ISLO80]**

<b>Principle</b>	<b>Resource Allocation Policy</b>	<b>Different Schemes</b>	<b>Major Advantages</b>	<b>Major Disadvantages</b>
Prevention	Conservative; undercommits resources.	Requesting all resources at once.	<ul style="list-style-type: none"> <li>•Works well for processes that perform a single burst of activity.</li> <li>•No preemption necessary</li> </ul>	<ul style="list-style-type: none"> <li>•Inefficient</li> <li>•Delays process initiation</li> <li>•Future resource requirements must be known</li> </ul>
		Preemption	<ul style="list-style-type: none"> <li>•Convenient when applied to resources whose state can be saved and restored easily</li> </ul>	<ul style="list-style-type: none"> <li>•Preempts more often than necessary</li> <li>•Subject to cyclic restart</li> </ul>
		Resource ordering	<ul style="list-style-type: none"> <li>•Feasible to enforce via compile-time checks</li> <li>•Needs no run-time computation since problem is solved in system design</li> </ul>	<ul style="list-style-type: none"> <li>•Preempts without much use</li> <li>•Disallows incremental resource requests</li> </ul>
Avoidance	Midway between that of detection and prevention	Manipulate to find at least one safe path	<ul style="list-style-type: none"> <li>•No preemption necessary</li> </ul>	<ul style="list-style-type: none"> <li>•Future resource requirements must be known</li> <li>•Processes can be blocked for long periods</li> </ul>
Detection	Very liberal; requested resources are granted where possible.	Invoke periodically to test for deadlock.	<ul style="list-style-type: none"> <li>•Never delays process initiation</li> <li>•Facilitates on-line handling</li> </ul>	<ul style="list-style-type: none"> <li>•Inherent preemption losses</li> </ul>

**Table 6.3 Windows 2000 Synchronization Objects**

<b>Object Type</b>	<b>Definition</b>	<b>Set to Signaled State When</b>	<b>Effect on Waiting Threads</b>
Process	A program invocation, including the address space and resources required to run the program	Last thread terminates	All released
Thread	An executable entity within a process	Thread terminates	All released
File	An instance of an opened file or I/O device	I/O operation completes	All released
Console Input	A text window screen buffer. (e.g., used to handle screen I/O for an MS-DOS application)	Input is available for processing	One thread released
File Change Notification	A notification of any file system changes.	Change occurs in file system that matches filter criteria of this object	One thread released
Mutex	A mechanism that provides mutual exclusion capabilities for the Win32 and OS/2 environments	Owning thread or other thread releases the mutant	One thread released
Semaphore	A counter that regulates the number of threads that can use a resource	Semaphore count drops to zero	All released
Event	An announcement that a system event has occurred	Thread sets the event	All released
Waitable Timer	A counter that records the passage of time	Set time arrives or time interval expires	All released

Note: Shaded rows correspond to objects that exist for the sole purpose of synchronization.
