1

Capacity Planning Process

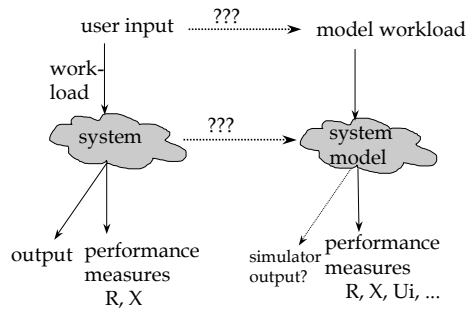

- How is it used?
 - fig. 2.1 [Men 94]
- Overall methodology
 - fig. 2.3 [Men 94]

11.3.2002

5

Use Models in Forecast

11.3.2002

Copyright Teemu Kerola 2002

6

Estimating Parameters ⁽⁵⁾

- CPU time for one Query?
 - usually routines A, B and C invoked
 - total nr of instructions executed in average: 2000
 - architecture speed: 2.3 clock cycles per instr.
 - 4600 clock cycles, 10 MHz cycle time,
4600/10000 ms = 0.46 ms
- Faster CPU? 15 MHz => 0.31 ms
- Better compiler? 1000 instructions => 0.23 ms
- New disk driver? new architecture?
- What if big variance in nr of instructions executed?
 - new job class? more details....

11.3.2002

Copyright Teemu Kerola 2002

7

Estimating Parameters ⁽⁷⁾

- CPU time for one Query?
- generate only Queries for 1 hr
 - disk completely utilized, no good data
- generate 10000 queries at 50 ms intervals
 - disk no a problem now?
- average CPU utilization 10.2%, time 80 s,
- CPU util when no Queries present: 4.5%
 - network, other work?
- Util for Queries: 5.7%, cpu time 5.7% x 80 s = 4.56 s
- cpu time per Query: 4.56 s / 10000 = 0.46 ms

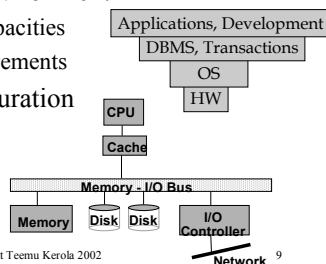

11.3.2002

8

What is Hard in Modeling?

- Need to understand whole system and environment before modeling
- Computing environment
 - resources, capacities
 - service requirements
- Device configuration
- Own SW
- Workload

11.3.2002

Copyright Teemu Kerola 2002

9

More Details in Model?

- Get more useful information
- System model becomes more complex
- Have more parameters; need to estimate them all
- Workload model becomes more complex
- Model solution becomes more complex
- E.g., if system load is high and transactions must queue for free memory partitions, then one should include memory in the model

11.3.2002

Copyright Teemu Kerola 2002

10

Less Details

- Might not get enough useful information
- May leave out something really important
- E.g., disk transaction time may depend on
 - I/O channels, queues for heads of SCSI strings
 - device controllers, disk caches,
 - file access protocol, rotation speed
 - etc etc
- May use average service demand $D_{\text{class,disk}}$ if not interested in where the time is spent

11.3.2002

Copyright Teemu Kerola 2002

11

Performance Prediction Methods

- Rules of Thumb
- Trend Analysis
- Operational Analysis
- Performance Models
 - analytical, simulation
- Benchmarks
 - best one is your own

11.3.2002

Copyright Teemu Kerola 2002

12

Job Classes or Transaction Classes

- Workload may have different classes of transactions (jobs)
- Complicates model and parameter estimation
- Complicates solutions and use
- Gives more usable information
- Can aggregate some classes to simplify model

11.3.2002

Copyright Teemu Kerola 2002

13

Priorities

- Job classes may have priorities at some resources
 - CPU
- Priorities may be dynamically changing
- Difficult to model well
- Complicates solutions

11.3.2002

Copyright Teemu Kerola 2002

14

Capacity

- What is capacity?
- Theoretical capacity
 - fig. 2.5 [Men 94]
 - pop N = Resp. Time * Throughput
 - E.g., $0.6 = 0.2 \frac{\text{sec}}{\text{transaction}} \times 5 \frac{\text{transactions}}{\text{sec}}$
- Effective Capacity
 - when some defined constraint is reached

open system?
flow out (X, throughput)
= flow in

11.3.2002

Copyright Teemu Kerola 2002

15

How to Compare Different Systems to Each Other?

- Time, throughput
- Benchmarks
 - standard (Whetstone, Linpack, ...)
 - own
- MIPS
- SPECmark
- TPC - Transaction Processing Council

11.3.2002

Copyright Teemu Kerola 2002

16

When is Load Measured?

- Peak load
 - fig. 2.7 [Men 94]

11.3.2002

Copyright Teemu Kerola 2002

17

What do you Measure?

- Performance
 - CPU utilization
- Other
 - availability
 - reliability
 - cost

11.3.2002

Copyright Teemu Kerola 2002

18

Requirements

- Something that must be met, or system fails
 - response time (e.g., less than 1 sec.)
 - throughput (e.g., at least 650 tps)
- MTTF - Mean Time To Fail
 - fig. 2.8 [Men94]
- Availability
 - fig. 2.8

$$MTTF = \frac{48 + 72}{2}$$

$$Availability = \frac{161}{168} = 95.8\%$$

11.3.2002

Copyright Teemu Kerola 2002

19

Performance Goals

- Throughput $X > 30$ tps
- Response time $R < 2$ sec
for 90% of the transactions
- Aver. resp. time for trivial transactions
 - $R_{triv} < 1$ sec
 - $T_{CPU} < 5$ msec, max 5 I/O's

11.3.2002

Copyright Teemu Kerola 2002

20

Performance Goals (contd)

- Availability $> 98\%$ (monthly?)
- command response time
 - local commands: < 0.5 sec
 - remote commands: < 1.5 sec
- MTTF > 10000 hours
- What system?
 - PC? Bank? Nuclear Power Plan?
 - Airport control system?
 - real time? hard real time?

11.3.2002

Copyright Teemu Kerola 2002

21

How to Characterize Workload?

- Example: mail Teemu.Kerola < aa.txt
- Basic components: 12 jobs
- Functional characteristics
 - software components?
 - mail? name server? file server?
 - network server?
- Resource characteristics
 - CPU time? I/O time? (per disk?)
 - memory usage?

12 times

11.3.2002

Copyright Teemu Kerola 2002

22

Workload Characterization

- Input, output:
 - Fig 2.10
- Representativeness
 - Fig. 2.11

11.3.2002

Copyright Teemu Kerola 2002

23

Mail Example

- 12 mail commands
- Resource usage
 - Tbl 2.1 [Men 94]
- Simple (single class) characterization
 - Tbl 2.2
- More complex characterization
 - cluster jobs into 2 classes based on response time
 - Tbl 2.3
- Input rate (λ)? Think time (Z)?
 - Fig 2.12

Which one is better?

11.3.2002

Copyright Teemu Kerola 2002

24

Workloads

(koetinkuormat)

- Real
- Synthetic
 - use part of real workload?
- Artificial
 - executable, not executable?
- Hybrid
- Kernel
- Non-executable
 - some abstraction of real workload
 - input for models
 - e.g., *average* service demand

11.3.2002

Copyright Teemu Kerola 2002

25

File Server Load

- Request distribution? 10 trans/sec
 - arrival rate? interarrival times? per class?
- File access probabilities? 60% disk-1
- File access file size distribution? 10% at most 1 sector, ...
- Read/write distribution? 10% are writes

11.3.2002

Copyright Teemu Kerola 2002

26

Workload Partitioning

- Based on some attribute
 - resource usage, application,
 - geographic orientation, functional attribute
 - etc etc etc
- Tbls 2.4 - 2.10 [Men 94]

11.3.2002

Copyright Teemu Kerola 2002

27

Clustering

- How to determine that one should use multiple classes?
- How to determine what jobs belong to which class?
- Cluster analysis (statistics)
 - fig. 2.13 [Men 94]

11.3.2002

Copyright Teemu Kerola 2002

28

Clustering Metrics

- How to decide if two jobs belong to the same class?
 - Tbl 2.11 [Men 94]
- Euclidean metric

$$d_{i,j} = \sqrt{\sum_{n=1}^K (D_{in} - D_{jn})^2}$$
 - geographical distance between two jobs (i, j) based on K attributes (n)
 - see p. 54 [Men 94] Euclidean measures
 - used scale may affect result - beware!
 - Does B&C make up a class? or A&B?

11.3.2002

Copyright Teemu Kerola 2002

29

Normalized Euclidean Metric

- Z score for each job *i* for each attribute *n*

$$Z_{in} = \frac{D_{in} - \bar{D}_n}{std.dev(D_{jn})}$$
- Distance measured as Euclidean distance between (normalized) Z scores (instead of raw measurements)
- See measures on p. 55 [Men 94]
- Another method to "normalize": use logarithm of the values instead of orig values
 - good when magnitude varies a lot

for attribute n
over all jobs j

11.3.2002

Copyright Teemu Kerola 2002

30

Clustering Algorithm

- k-means algorithm
 - Fig. 2.15 [Men 94]
 - Example, Tbl. 2.12-18 [Men 94]

11.3.2002

Copyright Teemu Kerola 2002

31

Workload Forecasting

- What is the value of some model parameter 5 months from now? 1 year from now?
- Must have this info to use models for forecasting

11.3.2002

Copyright Teemu Kerola 2002

32

System Model Parameters

- Workload model
 - use workload estimate to obtain system model parameter estimates
- Workload
 - Key Value Indicator
 - Natural Business Unit
 - Forecasting Business Unit
- System Model Parameters
 - Data base request arrival rate & distribution
 - Think time for interactive users

11.3.2002

Copyright Teemu Kerola 2002

33

Forecasting Techniques

- Trends
 - Fig. 2.16 [Men 94]
- Moving Average
 - Tbl. 2.21
- Exponential Smoothing
 - feedback loop from most recent forecast error

$$f_{t+1} = f_t + \alpha(y_t - f_t)$$

- Tbl. 2.22, Fig. 2.17

11.3.2002

Copyright Teemu Kerola 2002

34

Forecasting Techniques (contd)

- Regression Models
 - estimate is dependent on other variables
 - estimated variable (e.g., y) difficult to measure directly
 - dependent variables (e.g., x) easy to measure
 - make a small set of measurements for dependent variables (x) and estimate (y)
 - select factors (e.g., a & b) so that errors in estimate are smallest
 - use same factors for new dep. variable values
 - method of least squares
 - Tbl 2.23 [Men 94]

$$y = a + bx$$

11.3.2002

Copyright Teemu Kerola 2002

35

Performance Prediction

- Output: forecasts for different scenarios
 - Fig. 2.18 [Men 94]
- Different techniques
 - low vs. high complexity and cost
 - Fig. 2.19
 - Fig. 2.20

11.3.2002

Copyright Teemu Kerola 2002

36
