Additional comment on the exercise set 4

The exercise 3.1 says:

**3.1 Write down the log-likelihood for arbitrary distributions of the sources \( s_i \).**

This means:

Write down the log-likelihood \( \ell(A|z) \) of \( A \) in terms of the distribution \( p_s(s) \)

which may be arbitrary, assuming that the measurement data \( z \) is known.

Sorry about the late fix.
