1 Introduction

This document describes how this software (Ikayaki) is planned to be tested properly. Mainly this document concentrates on describing methods used for testing and test cases. It is important that all members of team to make tests in same way. This lowers possibility of testing conflicts and helps on integration test phase.

2 Overview of testing the system

Because program will be used to control a magnetometer, testing will be more important than in normal software engineering student projects. We will do unit testing for each class, integrate testing to program and use separate squid emulator to test squid interface system.

In unit testing each class is tested independently. Unit testing will be done by using JUnit. Every programmer will test his own classes. Class should be tested when it is finished and corrected before integration test begins.

Integration testing tests interfaces between classes. It will be done by going through all user interface protos and checking that all sections in requirements document can be done. Some critical sequences which are done many times with program should be done too.

Squid interface integration testing is done simulating real system with emulator. It will be done using Squid-emulator before testing it with real magnetometer. Squid-emulator runs in different machine and is connected by few (2-3) Serial I/O cables. Squid-emulator will be tested with old program (2G) same way before testing Ikayaki-system so that it will have all same tested properties which old program have and both systems have same results with squid emulator.

To verify that old program and new program works same way, we will do critical measurement with old program and emulator, save emulators log file and then use emulator with that log file and do same critical measurement with new program and see that both have same results.

If Rita testing utility is easy enough to use it will be used in testing. Tests will be constructed in such way that every line of code is visited at least once.

3 Testing

3.1 Unit Testing

Unit Testing is done for each class separately. Classes tested with JUnit have it's own ClassNameTest.java class in test-directory and gui-components are tested manually. They should be done before and during coding class. All test cases must be executable after classes are ready. Every class should be tested succesfully before integration tests.

All test cases are listed in sections 4 and 5.

3.2 Integration Testing

Integration testing is mostly done after unit tests are passed for all classes. Testing is done using squid emulator at first and finally with real Squid system. Graphical User Interface is mainly tested in Unit testing and is only looked that all components work together as Squid Interface is tested.

Integration testing for GUI-components is done using top-down method. Testing is done partly during implementation phase, when new components are added to program. After adding component to program it is tested to work properly with other components.

Graphical User Interface is tested using all use cases from 6. If one fails, it is corrected immediately and all use cases must be done again. When all use cases are done without errors this phase is ready.

Squid Interface testing is done with Emulator. Use cases are Automatic Measurement, Thellier Measurement and Manual Measurement with all variations (see 6). In first phase we use old program with emulator, save its log file and take results. After that we run it with new program and compare results. If they are not same, corrections are made immediatelly to new program and test is run again. This is done until results are same for all use cases.

3.3 Squid Emulator

Squid emulator is tested with old program. Use cases are Automatic Measurement, Thellier Measurement and Manual Measurement with all variations (see Requirements Document). When all use cases can be done with emulator it is ready enough for integration testing.

This should be done so that Old Program has same results with SQUID-system and emulator for all use cases. But we don't have resources for this. So this test only tells us that Old and New program works same way with squid emulator.

4 JUnit test cases

Here are listed JUnit test cases for classes.

JUnit is simple java-based framework for testing your java classes. We use it in this project for Unit Testing. For more information visit http://junit.sourceforge.net/.

First you need to download JUnit from http://sourceforge.net/project/showfiles.php?group _id=15278 and extract it to directory (different than java directory) and set classpath for it.

Then you must write test class for every class to be tested. Test classes extend TestCase. They will have test methods, one for each Test Case. Test class also need suite()-method and Main for run. Sample test class:

```
import java.util.*;
 import junit.framework.*;
 public class SimpleTest extends TestCase {
 //Simple Test Case
 public void testEmptySimple() {
        Simple simple = new Simple();
        //New Simple must be empty
        assertTrue(simple.isEmpty());
  }
 public static Test suite() {
        return new TestSuite(SimpleTest.class);
  }
 public static void main(String args[]) {
        junit.textui.TestRunner.run(suite());
  }
}
```

Type "java junit.swingui.TestRunner SimpleTest" to run test cases for Simple.

5 GUI-component test cases

Here are listed test cases for gui-classes, these are done manually just clicking and changing values.

5.1 Ikayaki/MainViewPanel

1. Starting the program

These have been tested with test-ikayaki.bat.

• Starts up correctly, everything works as supposed

Test: No parameters...

Result: OK

Test: Parameter "*/?" (which doesn't exist)...

Test: Parameter "projects/test.ika" (which exists, should open it)...

Result: OK

Test: No parameters and without config file...

Result: OK

Test: No parameters, with config file left from previous...

Result: OK

Test: Parameter "projects/test.ika" (which exists, should open it), and without

config file... Result: OK

Test results for Ikayaki/MainViewPanel: 6/6

5.2 ProjectExplorerPanel

1. Directory text field

• Shows autocomplete popup when typing and typed text matches to one or more directory

Test: Typed different letters, worked fine. Funny results with '.' and it searched subdirectories with '..'

Result: OK

• Shows directory history on down-arrow click

Test: Works fine, only down-arrow fires this when no autocomplete pop-up is active

Result: OK

• Too long lines in popup are shortened

Test: Tried both pop-ups

Result: OK

• Tries to change directory when on enter press or mouse-click to popupmenu (UC21)

Test: Mouse click on autocomplete pop-up didnt work, history ok

Result: FAILED!

• Only allows correct and existing directories (flashes red on change-attempt if invalid)

Test: Tried existing and non-existing directories, ok. But with '.' and '..' it tries to open those. Strange.

Result: OK

2. Browse-button

• Opens a dir chooser dialog

Test: Tried with different values on Directory text field. Opened last good directory in dialog.

• Changes to chosen directory if "Open" selected; updates text field (UC21)

Test: Opens only if directory exists

Result: OK

3. Project file table

• Shows project files in current directory

Test: Updates on the fly while changing directories

Result: OK

• Only shows project files (.ika and Calibration/AF/Thellier/Thermal)

Test: Tried various directories

Result: OK

• Hilights open project

Test: Changed project with mouse and keyboard

Result: OK

• Hilights (with different color) currently measuring project

Test: Colors work fine combined with open-measure, multiple selections.

Result: OK

• Loads project on project file mouseclick (UC20)

Test: Opens on left-mouse click only

Result: OK

• Show export menu for clicked file on right-click

Test: Works both single and multiple selections and dont open if no selections

Result: OK

• Export to selected file if any chosen (UC13-UC15)

Test: Single and multiple exports fine, only dat is supported?

Result: OK

• Sorts data on header click

Test: Tested all three choices in all combinations

Result: OK

• Updates data if changed (modifield-column, that is)

Test: Tested changing between two directories

Result: OK

4. "Create New" -components

• Only allows correct, non-existing files; flashes red if invalid

Test: \ don't work. Checks name for all differend projects, cannot have same named project in AF and Thellier for example

Result: FAILED!

• If valid filename, creates it, updates table with created file selected (UC19)

Test: Tested with various new Projects, AF, Thellier and Thermal

Result: OK

Test results for ProjectExplorerPanel: 16/18

5.3 CalibrationPanel

1. Calibration project table

• Shows (and only shows) calibration project files in current directory

Result: OK

• Hilights open project

Result: OK

• Hilights (with different color) currently measuring project

Result: OK

• Loads project on project file mouseclick (UC20)

Result: OK

• Doesn't show export menu for clicked file on right-click

Result: FAILED!

• Sorts data on header click

Result: OK would be better if always in same order

• Updates data if changed (measured- and elapsed-columns, that is)

Result: OK

2. "Calibrate" -button

• Does whatever "Single Step" -button does (see MeasurementControlsPanel)

(UC8-UC10) Result: OK

Test results for CalibrationPanel: 7/8

5.4 MeasurementControlsPanel

1. Measuring buttons

• All of them are enabled/disabled by good manners

Result: OK

• On click, all of them execute their measuring command without unjustified

complaints (UC1-UC7)

Result: OK

• Flash red on click if action can't be done

Result: OK

2. +Z/-Z info/radiobuttons

• Shows correct orientation for current project

 Changes orientation on +z or -z radiobutton click Result: OK

- 3. Magnetometer status picture
 - Always shows handler position and rotation as supposed...

Result: OK

• Updates smoothly ^^

Result: OK

- 4. Handler manual controls (radiobuttons)
 - Disabled if "normal" measuring in action, enabled otherwise Result: OK
 - Executes desired action (if possible; can't tell) (UC11)

Result: OK

• Stack move-radiobuttons correctly (never on top of each other or missing)
Test: Any two handler positions are set (in Settings) to same location (number)...

Result: FAILED!

- 5. Magnetometer/demagnetizer manual controls (buttons)
 - Disabled if "normal" measuring in action, enabled otherwise if applicable Result: OK
 - Enable/disable and update text according to current handler position and rotation

Result: FAILED!

• Executes desired action (if possible; flash red if not) (UC11) Result: OK

Test results for MeasurementControlsPanel: 11/13

5.5 ProjectInformation

- 1. Textfields
 - Number fields only accept numbers Result: OK
- 2. Auto save
 - Project automatically saves inputted information Result: OK
- 3. Project change

 Radiobuttons and textfields display new projects data Result: OK

Test results for ProjectInformation: 3/3

5.6 MeasurementSequence

- 1. Start, Step and Stop
 - Textfields only accept positive numbers

Test: "0"
Result: OK
Test: "bf"
Result: OK
Test: "-1"
Result: OK

• Minimum step value is 0,1

Result: OK

• Stop value must be higher than start

Test: start "2,2", stop "2"

Result: OK

• Largest possible stop value cannot be higher than what magnetometer can handle (as set in Device Configuration)

Test: "400" Result: OK

- 2. Add Sequence-button
 - Sequences are added into projects

Result: OK

- Sequences cannot be added to calibration projects Result: OK (but sequence components should be disabled)
- 3. Sequence selection combobox
 - Combobox cannot have two or more sequences with same name

Result: OK (asks to overwrite)

• Sequences can be deleted from list

Result: OK (can be deleted from Options)

- 4. Sequence-table
 - Unmeasured AF/Temp column values can be edited and only accept valid numbers

Test: 0

Result: OK

Test: 1

Result: OK (changes to 1,1)

Test: -1

Result: **FAILED!** -> clears textbox and moves to table first row:)

Test: "f"

Result: **FAILED!** -> NumberFormatException

• Data is displayed correctly

Result: OK

• New rows can be added to end of table

Result: OK

• Right-clicking headers brings up column selection popupmenu

Result: OK

• Right-clicking table brings up general purpose popupmenu

Result: OK

5. Column selection popupmenu

• Selected or deselected columns are displayed or hidden correctly

Test: Deselected and selected all

Result: OK

6. General purpose popupmenu

• Allows inserting rows to any place in table (except after last)

Test: Before and after first, before and after last, random in the middle

Result: OK

• Allows deleting rows (except the last one)

Test: Delete first, delete last, delete random, delete all

Result: OK

• Rows with measurement data cannot be deleted

Test: Select measured, overlap with unmeasured

Result: OK

• Allows saving rows as sequence into combobox

Test: Save first, save one-before-last, save all

Result: OK

7. Project change

• Table shows columns which where visible last time new project was closed

Result: OK

• Table shows information of the new project

Result: OK

Test results for MeasurementSequence: 23/25

5.7 MeasurementDetails

- 1. MeasurementDetails-table
 - Shows measurement details in useful and readable form
 Result: OK (but whilst measuring, rows replace each other in a weird fashion)
 - Numbers are correct for measurements

Result: OK (hope so..)

• Shows right number of rows initially, defined by project

Result: OK

• Table extends as needed

Result: OK

- 2. ErrorDetails-table
 - Shows error in useful and readable form

Result: FAILED!

• Error is calculated correctly

Result: FAILED!

- 3. Project change
 - Tables show information of the new project Result: OK

Test results for MeasurementDetails: 5/7

5.8 SettingsPanel

- 1. Magnetometer, Handler and Degausser COM-port combobox
 - Shows all COM-ports on system in alphabetical order Result: OK

• Loads correct COM port from Settings

Result: OK

 Doesn't allow same value as in Handler and Magnetometer/Degausser COMport comboboxes

Result: FAILED!

- 2. Save button
 - Only available if changes are made and values are permissible Result: **FAILED!** always available

• Unavailable on start

Result: FAILED!

 On click closes window and saved data correctly Result: OK

3. Cancel button

• On click closes window and doesnt save changes

Result: OK

• Always available

Result: OK

4. Calibration constants

• Loads data correctly from Settings

Result: OK

• Accepts positive and negative decimal numbers

Test: -0.430002 Result: OK

5. Degausser ramp

• Loads data correctly from Settings

Result: OK

• Has only elements: 3,5,7,9

Result: OK

6. Degausser delay

• Loads data correctly from Settings

Result: OK

• Has only elements: 1..9

Result: OK

7. Acceleration and deceleration fields

• Loads data correctly from Settings

Result: OK

• Accepts only values in range of Integers 0..127

Test: 1000 Result: OK Test: -10 Result: OK Test: -1 Result: OK

Test: 0

Result: OK Test: 1

Test: 54 Result: OK Test: 127 Result: OK Test: 128 Result: OK

8. Velocity and velocity in measurement fields

• Loads data correctly from Settings

Result: OK values of over 8500 are not saved

• Accepts only values in range of Integers 50..20000

Test: 0

Result: OK 0 is initial value to which cannot be returned after changing to

value 50..8500

Test: 2001 Result: OK Test: -1 Result: OK Test: 1

Test: 1 Result: OK Test: 8500 Result: OK Test: 10000 Result: OK Test: 20000 Result: OK

Test: 20001 Result: OK

9. Translation positions fields

• Loads data correctly from Settings

Result: **FAILED!** rotation velocity behaves like velocity and velocity measurement

• Tranverse T AF..Measurement accept only values in range of Integers 0..16777215

Test: -1 Result: OK

Test: 0 Result: OK

Test: 1 Result: OK Test: 16777215

Test: 167772156 Result: OK

• Rotation acc. and dec. accepts values from 0..127

Result: **FAILED!** only accepts values from 0..127, but always loads with

initial 127 or 54 respectively

• Rotation counts behaves correctly

Result: **FAILED!** behaves strangely with very large or small numbers (what

should this accept?)

Test results for SettingsPanel: 34/40

6 Integration test cases

Here is test case which is done in integration phase to all components at same time. This is done in following order and must be repeated until done successfully. Variations can be made to ensure that all works in different situations.

6.1 Automatic AF Measurement

1. Open software

• Last project is opened, if available.

Result: OK

• All components are in right place

Result: OK

2. Select Holder noise calibration

opens Sample holder calibration project in Measurement Sequence and Information

Result: OK

result. OII

• disables Measurement Controls, except single step

Result: OK

• enables calibrate button

Result: OK

• disables editing sequence

Result: FAILED! fields/buttons not disabled, but adding sequence doesn't

work

3. Click Calibration button

• Adds new line in Sequence at bottom

• Starts calibration, progress shown on measurement controls Result: **FAILED!** progress is shown wrong, works otherwise

• Data is updated correctly in Measurement Details

Result: OK

• Stop button enabled

Result: OK

• New data added to Measurement Sequence

Result: OK

4. Calibration finished

• Stop button is disabled

Result: OK

• Last modified is updated Sample Holder

Result: OK

5. Select standard sample

 opens Standard Sample calibration project in Measurement Sequence Result: OK

6. Click Calibration button

• Adds new line in Sequence at bottom

Result: OK

• Starts calibration, progress shown on measurement controls Result: **FAILED!** progress is shown wrong, works otherwise

• Data is updated correctly in Measurement Details

Result: OK

• Stop button enabled

Result: OK

• New data added to Measurement Sequence

Result: OK

7. Calibration finished

• Stop button is disabled

Result: OK

• Last modified is updated in Standard Sample

Result: OK

8. Create new AF project

• Calibration project is closed

• new AF project is opened with given name (ProjectInfo, MeasurementSequence)

Result: OK

• Measurement Controls has enabled buttons Measure, Single Step and disable Pause, Stop Now!

Result: OK

9. Add project Information

• All data is accepted

Result: OK

10. Load Set

• Loaded set is correctly added to Sequence

Result: OK

11. Click Measure

• Disables Measure, Single Step, enables Pause, Stop Now!

Result: OK

• Rows are highlighted in Explorer and Sequence

Result: OK

• Starts measuring first phase correctly (no demag now)

Result: OK

• Picture of demagnetizer is up-to-date

Result: FAILED!

• Plots are drawn during phase

Result: OK

• Continues on next phase and does demag first

Result: OK

• Updates Details and Sequence

Result: OK

• Measured sequence cannot be changed

Result: OK

12. Pause button

• Finish current measure and stops after that

Result: OK

• Disables Pause button

Result: OK

• When finished disables Stop Now! and enables Measure, Single Step

13. Sequence edit

• Steps not yet measured, can be changed Result: OK

14. Single step button

• Performs Next phase on measure

Result: OK

• Disables Measure button and Single Step button, enables Stop Now!

Result: OK

15. Measure button

• Disables Meausre, Single Step, enables Pause, Stop Now!

Result: OK

• Rows are highlighted in Explorer and Sequence

Result: OK

Continues from Next phase

Result: OK

• Picture of demagnetizer is up-to-date

Result: OK

• Plots are drawn during phase

Result: OK

• Continues on next phase

Result: OK

• updates Details and Sequence

Result: OK

16. Stop Now! button

• Stops measurement immediately Result: OK or as fast as machine can be stopped

Test results for Automatic AF Measurement: 44/48

6.2 Thellier Measument

1. Open software

• Last project is opened, if available.

Result: OK

• All components are in right place

- 2. Open existing Thellier project
 - Project is opened correctly in Information and Sequence Result: OK
 - Measure button is hidden, Single step enabled and Stop now Disabled Result: OK
- 3. Add new line in sequence
 - It's inserted correctly. Result: OK
- 4. Click Single Step button
 - Performs Next phase on Sequence

Result: OK

• Disables Single Step button, enables Stop Now!

Result: OK

• Rows are highlighted in Explorer and Sequence

Result: OK

• Picture of demagnetizer is up-to-date

Result: FAILED!

• Plots are drawn

Result: OK

• updates Details and Sequence

Result: OK

Test results for Thellier Measument: 10/11

6.3 Manual Measurement

- 1. Open software
 - Last project is opened, if available.

Result: OK

• All components are in right place

Result: OK

- 2. Create new AF/Thellier project
 - new AF/thellier project is opened with given name (ProjectInfo, Measurement Sequence)

• Measurement Controls has enabled buttons Measure, Single Step and disables Pause, Stop Now!

Result: OK

- 3. Adding project data and selecting manual
 - Data is accepted correctly

Result: OK

• Manual is enabled

Result: OK

- 4. Rotate handler
 - Rotation changes on image of squid

Result: OK

• Squid-system rotates

Result: OK

- 5. Move handler to specific place
 - Image of squid animates correctly and stops on right position Result: **FAILED!** stops in right position, but animation is wrong
 - Squid-system moves to exact place

Result: OK

- 6. Demagnetize
 - Demagnetization is shown on squid image

Result: OK

• Squid-system demagnetizes

Result: OK

- 7. Measure-all
 - Measuring is shown on squid image

Result: OK

• Data is added to Details correctly

Result: OK

• Data is added to Sequence

Result: OK

- 8. Reset measure
 - Nothing shown, Magnetometer is reseted.

Result: OK

Test results for Manual Measurement: 15/16
