Mobile Middleware Course

Introduction and Overview

Sasu Tarkoma
Contents

- Lecture outline
- Motivation
- Mobile middleware overview
- Examples
- Summary
Lecture Outline

- 3 credit course + 2 credits for an optional assignment
- 15.3. Introduction and overview.
- 22.3. Mobile platforms.
- 29.3. Mobile platforms continued.
- 5.4. Support technologies.
- 12.4. Principles and patterns.
- 26.4. Applications and service case studies.

- Exam: 5.5. 9-12 in B123
Course Book

- Mobile Middleware – Architecture, Patterns, and Practice published by Wiley
  - Publication date 27.3.2009
- Several papers to read including a summary of the course
Introduction to Mobile Middleware
Motivation

- Mobile computing has become one of the breakthrough technologies of today
  - Over 3.3 billion mobile phones in use, 4 billion SIM cards
- Current trend is converged communications
  - Web resources integrate seamlessly with mobile systems
  - Mobile systems are increasingly dependent on software
- We give a comprehensive overview of mobile middleware technology
Mobile Evolution

1st generation (1990-1999)
- Text messages (SMS) and mobile data. Speeds up to tens of Kbps.

- Limited browsers, WAP, iMode, and MMS. Speeds up to 144Kbps.

3rd generation (2003-2008)
- Mobile platforms, middleware services. Series 60, J2ME, Android, iPhone. Speeds up to several Mbps.

4th generation (2008-)
- Adaptive services, user interfaces, and protocols. Context-awareness, always-on connectivity. Speeds up to hundreds of Mbps.
- Emergence of app stores.
- Versatile devices: smartphones, pads.
- Cloud-assisted applications with social networks.
Wireless Technologies

- Global System for Mobile (GSM),
- General Packet Radio Service (GPRS)
- Universal Mobile Telecommunications System (UMTS)
- Long Term Evolution (LTE)
- Wireless LAN (WLAN)
- Worldwide Interoperability for Microwave Access (WiMax)
- Ultra-wideband (UWB)
- Wireless Personal Area Network (WPAN)
- Bluetooth, Wibree
- RFID
WiMAX

Bandwidth
200 Mbps
54 Mbps
5-11 Mbps
4 Mbps
1 Mbps
384 Kbps
56 Kbps

Range
10 - 30 m
50-200 m
200 m-4 km
5 km -20 km

802.11n
802.11a, g
802.11b
802.15.1

802.11a,g point-to point
WiMAX

UMTS/WCDMA-HSDPA, CDMA 2000-1xEVDO

UMTS/WCDMA, CDMA 2000
IS-95, CDMA, GSM

LTE Advanced: 4G, 1 Gbps
3G enhanced
3G
2G
Range
Mobility in the Internet

- This topic pertains to mobility of
  - Networks
  - Hosts
  - Transport connections
  - Sessions
  - Objects (passive, active)
  - Services
  - Users

- Many solutions are needed on multiple layers
  - Link layer, network, transport, application
Users of Middleware

- **End user.** The goal of middleware is not to directly interact with the end users, but rather support the applications and services that are visible to the users. This means that middleware should provide sufficient APIs and mechanisms to cope with different kinds of failures and faults, and in general support enhanced usage experience.

- **Device Manufacturers.** Device manufacturers use middleware in order to provide extended features that interface with device drivers.

- **Internet Service Providers.** Internet service providers utilize middleware to monitor and administer the network.

- **Platform Providers.** Platform providers develop middleware platforms that integrate with different operating systems.

- **Application Service Providers.** Application service providers utilize middleware in order to facilitate application development and deployment in a scalable and secure manner.
Key Elements

- **Accessibility**
  - Resources are available and accessible for end users irrespective of the current location or where resources are located.

- **Reachability**
  - Resources should be available in any location. Reachability cannot be taken for granted in today’s dynamic environment.

- **Adaptability**
  - The environment is subject to changes. Mobile service usage needs to adapt to the operating environment.

- **Trustworthiness**
  - The various entities in the environment need to have certain level of trust that operations are carried out according to expectations (and contracts).

- **Universality**
  - Universal data access is one of the key reasons for the success of the Internet. This is a key element for the success of the mobile service ecosystem.
Middleware

- Widely used and popular term
- Fuzzy term
- One definition
  - “A set of service elements above the operating system and the communications stack”
- Second definition
  - “Software that provides a programming model above the basic building blocks of processes and message passing” (Colouris, Dollimore, Kindberg, 2001)
Why Middleware?

- Application development is complex and time-consuming
  - Should every developer code their own protocols for directories, transactions, ..?
  - How to cope with heterogeneous environments?
    - Networks, operating systems, hardware, programming languages

- Middleware is needed
  - To cut down development time
    - Rapid application development
  - Simplify the development of applications
  - Support heterogeneous environments and mask differences in OS/languages/hardware
Middleware cont.

Middleware services include:
- directory, trading, brokering
- remote invocation (RPC) facilities
- transactions
- persistent repositories
- location and failure transparency
- messaging
- Security

Network stack (transport and below) is not part of middleware.
Middleware provides various transparencies (HW, OS, location, fault, ..) for apps.

APIs for: RPC, messaging, transactions, session management, storage, directories, trading, etc.
The Hourglass

- Diverse applications
- Divergence
- Transport layer (TCP/IP)
- Convergence
- Diverse physical layers
Examples

- Remote Procedure Call (RPC)
  - call of a remote procedure as it were local
  - marshalling / unmarshalling

- Remote Method Invocation (RMI)
  - call of a remote method as it were local
  - marshalling / unmarshalling

- Event-based computing
  - entities receive asynchronous notifications
  - a notification causes a state change

- Overlays and P2P content delivery
Transparencies

- Location transparency
  - RPC and RMI used without knowledge of the location of the invoked procedure / object

- Transport protocol transparency
  - RPC may be implemented using any transport protocol

- Transparency of OS and hardware
  - RPC/RMI uses external data representation
  - Presentation is important
  - XML is becoming increasingly important

- Transparency of programming languages
  - Language independent definition of procedures: CORBA IDL, WSDL
Mobile Middleware

- Middleware is typically designed and implemented for fixed-network hosts
  - High bandwidth, low latency, reliable communication
  - Persistent storage, sufficient computing power, power supply
  - No mobility

- Mobile environment requires new solutions
  - Existing middleware services do not scale
  - Small devices and embedded systems pose different challenges
Reflection

- In general, middleware provides transparency to the underlying conditions
  - Location transparency in RPC/RMI
- In mobile environments this is not always desired
  - Sometimes we need to know about location changes, QoS changes, etc.
- Requirement for reflective middleware
  - Should expose APIs for querying / changing important parameters
  - Under development
Mobile Service Development

- The mobile landscape is fragmented
  - Heterogeneous device base
  - Many different wireless technologies
- The situation is challenging for the developer
  - Many APIs
  - Many middleware platforms
  - APIs evolve over time
- Current challenge of the industry pertains to improving the development processes
Mobile middleware aims to support the development, deployment, and execution of distributed applications in the heterogeneous and dynamic mobile environment.

The goals for mobile middleware include adaptability support, fault-tolerance, heterogeneity, scalability, and context-awareness.

The industry solution to these challenges has been to create middleware platforms.

A platform collects frequently used services and APIs under a coherent unified framework.
Platforms

- Java Micro Edition (Java ME)
- iPhone
- Symbian and Series 60
- Windows Phone 7
- Linux Maemo (MeeGo)
- Android
- BREW
- WAP
- OSGi
- Python
- Flash Lite
- Opera Mini
Support Technologies

- Session Initiation Protocol (SIP)
- IP Multimedia Subsystem (IMS)
- Web Services
- IP Television (IPTV)
- SQLite
- OpenGL ES
- PAMP
Example: SIP

Connections:
- DNS Server to Location Service
- Proxy Server to Proxy Server
- User Agent Alice to User Agent Bob
- SIP (SDP) transmission between Proxy Servers
- Media (RTP) transmission between User Agents
Service Discovery

- UPnP
- Jini
- Service Location Protocol (SLP)
- ZeroConf
Example: UPnP

0 Control point and device get addresses
1 Control point finds interesting device
2 Control point learns about device capabilities
3 Control point invokes actions on device
4 Control point listens to state changes of device
5 Control point controls device and/or views device status using Web browser
Mobility Solutions

- Mobility and multi-homing can be realized on different layers
  - Network
    - Mobile IP, HMIP, NEMO
  - Between network and transport
    - Host Identity Protocol (HIP)
  - Transport (SCTP)
    - TCP extensions, SCTP (TrASH)
  - Application
    - SIP, Wireless CORBA, overlays
    - Re-establish TCP-sessions after movement
Advanced Topics

- Overlay Networks
- Context-awareness
- Service composition
- Security and Trust
- Charging and Billing
Summary

- Mobile middleware
  - Desktop middleware not usable on small, mobile devices
  - The mobile and wireless environment is different from the traditional fixed-network computing environment
  - Special solutions are needed
    - Decoupling, context-awareness, adaptation, ..
  - J2ME, WAE, Wireless CORBA, ..

- Current trends
  - Flexibility, decoupled nature
  - Convergence / unification
