Chapter 1: 
Distributed Systems: 
What is a distributed system?

Fall 2008
Jussi Kangasharju
Course Goals and Content

Distributed systems and their:

- Basic concepts
- Main issues, problems, and solutions
- Structured and functionality

Content:

- Distributed systems (Tanenbaum, Ch. 1)
  - Architectures, goal, challenges
  - Where our solutions are applicable
- Synchronization: Time, coordination, decision making (Ch. 5)
- Replicas and consistency (Ch. 6)
- Fault tolerance (Ch. 7)

Chapters refer to Tanenbaum book
Course Material

- Tanenbaum, van Steen: Distributed Systems, Principles and Paradigms; Prentice Hall 2002

- Coulouris, Dollimore, Kindberg: Distributed Systems, Concepts and Design; Addison-Wesley 2005

- Lecture slides on course website
  - NOT sufficient by themselves
  - Help to see what parts in book are most relevant
Course Exams

- Normal way (recommended)
  - Exercises, home exercises, course exam

- Grading:
  - Exam 48 points
  - Exercises 12 points (~ 20 exercises, scaled to 0—12)
  - Home exercises 6 points (3 exercises)
  - Grading based on 60 point maximum
  - Need 30 points to pass with minimum 16 points in exam
  - 50 points will give a 5

- Possible to take as separate exam
Exercises

Weekly exercises:
- Smaller assignments

Home exercises
- 1 study diary, 2 design exercises
- Due dates will be announced later
- Study diary individual work
- Design exercises can be done in groups of up to 3
People

- Jussi Kangasharju
  - Lectures: Mon 14-16 and Thu 10-12 in D122
  - Office hour: Tue 12-13 or ask for appointment by email

- Mika Karlstedt
  - Exercise groups:
    - 1. Mika Karlstedt Tue 12-14 in C221 (in English)
    - 2. Mika Karlstedt Thu 12-14 in CK111
  - Home exercises
  - Office hour: During exercises or ask appointment by email
Questions?
Chapter Outline

- Defining distributed system
- Examples of distributed systems
- Why distribution?

- Goals and challenges of distributed systems

- Where is the borderline between a computer and a distributed system?
- Examples of distributed architectures
Definition of a Distributed System

A distributed system is

a collection of independent computers
that appears to its users
as a single coherent system.

... or ...

as a single system.
Examples of Distributed Systems

The Internet: net of nets
global access to “everybody”
(data, service, other actor; open ended)

- enormous size (open ended)
- no single authority
- communication types
  - interrogation,
  announcement,
  stream
  - data, audio, video

CoDoKi, Fig. 1.1

Figure 1.1 A typical portion of the Internet
Examples of Distributed Systems

Intranets (CoDoKi, Fig. 1.2)
- a single authority
- protected access
  - a firewall
  - total isolation
- may be worldwide
- typical services:
  - infrastructure services: file service, name service
  - application services

Figure 1.2 A typical intranet
Examples of Distributed Systems

Mobile and ubiquitous computing (CoDoKi Fig 1.3)

- Portable devices
  - laptops
  - handheld devices
  - wearable devices
  - devices embedded in appliances

- Mobile computing
- Location-aware computing
- Ubiquitous computing, pervasive computing

Figure 1.3 Portable and handheld devices in a distributed system
Mobile Ad Hoc -Networks

Mobile nodes come and go
No infrastructure
- wireless data communication
- multihop networking
- long, nondeterministic dc delays

Problems, e.g.:
- reliable multicast
- group management
Resource Sharing and the Web

- Hardware resources (reduce costs)
- Data resources (shared usage of information)
- Service resources
  - search engines
  - computer-supported cooperative working
- Service vs. server (node or process)

Figure 1.4 Web servers and web browsers
Examples of Distributed Systems, 4

Distributed application

• one single “system”
• one or several autonomous subsystems
• a collection of processors => parallel processing
  => increased performance, reliability, fault tolerance
• partitioned or replicated data
  => increased performance, reliability, fault tolerance

Dependable systems, grid systems, enterprise systems
Why Distribution?

Sharing of information and services
Possibility to add components improves availability
reliability, fault tolerance
performance
scalability

Facts of life: history, geography, organization
Goals and challenges for distributed systems
Goals

- Making resources accessible
- Distribution transparency
- Openness
- Scalability
- Security
- System design requirements
Challenges for Making Resources Accessible

- Naming
- Access control
- Security
- Availability
- Performance
- Mutual exclusion of users, fairness
- Consistency in some cases
Challenges for Transparency

The fundamental idea: a collection of
- independent, autonomous actors

Transparency
- concealment of distribution =>
- user’s viewpoint: a single unified system
## Transparencies

<table>
<thead>
<tr>
<th>Transparency</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access</td>
<td>Hide differences in data representation and how a resource is accessed</td>
</tr>
<tr>
<td>Location</td>
<td>Hide where a resource is located (*)</td>
</tr>
<tr>
<td>Migration</td>
<td>Hide that a resource may move to another location (*)</td>
</tr>
<tr>
<td></td>
<td>(the resource does not notice)</td>
</tr>
<tr>
<td>Relocation</td>
<td>Hide that a resource may be moved to another location (*)</td>
</tr>
<tr>
<td></td>
<td>while in use (the others don’t notice)</td>
</tr>
<tr>
<td>Replication</td>
<td>Hide that a resource is replicated</td>
</tr>
<tr>
<td>Concurrency</td>
<td>Hide that a resource may be shared by several competitive users</td>
</tr>
<tr>
<td>Failure</td>
<td>Hide the failure and recovery of a resource</td>
</tr>
<tr>
<td>Persistence</td>
<td>Hide whether a (software) resource is in memory or on disk</td>
</tr>
</tbody>
</table>

(*) Notice the various meanings of "location": network address (several layers); geographical address
Challenges for Transparencies

- replications and migration cause need for ensuring consistency and distributed decision-making
- failure modes
- concurrency
- heterogeneity
## Figure 2.10
Omission and arbitrary failures

<table>
<thead>
<tr>
<th>Class of failure</th>
<th>Affects</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fail-stop</td>
<td>Process</td>
<td>Process halts and remains halted. Other processes may detect this state.</td>
</tr>
<tr>
<td>Crash</td>
<td>Process</td>
<td>Process halts and remains halted. Other processes may not be able to detect this state.</td>
</tr>
<tr>
<td>Omission</td>
<td>Channel</td>
<td>A message inserted in an outgoing message buffer never arrives at the other end’s incoming message buffer.</td>
</tr>
<tr>
<td>Send-omission</td>
<td>Process</td>
<td>A process completes <em>send</em>, but the message is not put in its outgoing message buffer.</td>
</tr>
<tr>
<td>Receive-omission</td>
<td>Process</td>
<td>A message is put in a process’s incoming message buffer, but that process does not receive it.</td>
</tr>
<tr>
<td>Arbitrary (Byzantine)</td>
<td>Process or channel</td>
<td>Process/channel exhibits arbitrary behaviour: it may send/transmit arbitrary messages at arbitrary times, commit omissions; a process may stop or take an incorrect step.</td>
</tr>
</tbody>
</table>
### Figure 2.11
Timing failures

<table>
<thead>
<tr>
<th>Class of Failure</th>
<th>Affects</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clock</td>
<td>Process</td>
<td>Process’s local clock exceeds the bounds on its rate of drift from real time.</td>
</tr>
<tr>
<td>Performance</td>
<td>Process</td>
<td>Process exceeds the bounds on the interval between two steps.</td>
</tr>
<tr>
<td>Performance</td>
<td>Channel</td>
<td>A message’s transmission takes longer than the stated bound.</td>
</tr>
</tbody>
</table>
Failure Handling

- More components => increased fault rate
- Increased possibilities
  - more redundancy => more possibilities for fault tolerance
  - no centralized control => no fatal failure
- Issues
  - Detecting failures
  - Masking failures
  - Recovery from failures
  - Tolerating failures
  - Redundancy
- New: partial failures
Concurrent Programming

- Several simultaneous users => integrity of data
  - mutual exclusion
  - synchronization
  - ext: transaction processing in databases
- Replicated data: consistency of information?
- Partitioned data: how to determine the state of the system?
- Order of messages?

There is no global clock!
Consistency Maintenance

- Update ...
- Replication ...
- Cache ...
- Failure ...
- Clock ...
- User interface ....

... consistency
Heterogeneity

- Heterogeneity of
  - networks
  - computer hardware
  - operating systems
  - programming languages
  - implementations of different developers

- Portability, interoperability
- Mobile code, adaptability (applets, agents)
- Middleware (CORBA etc)
- Degree of transparency? Latency? Location-based services?
Challenges for Openness

- Openness facilitates
  - interoperability, portability, extensibility, adaptivity

- Activities addresses
  - extensions: new components
  - re-implementations (by independent providers)

- Supported by
  - public interfaces
  - standardized communication protocols
Challenges for Scalability

- Scalability
- The system will remain effective when there is a significant increase in:
  - number of resources
  - number of users
- The architecture and the implementation must allow it
- The algorithms must be efficient under the circumstances to be expected
- Example: the Internet
Challenges: Scalability (cont.)

- Controlling the cost of physical resources
- Controlling performance loss
- Preventing software resources running out
- Avoiding performance bottlenecks
- Mechanisms (implement functions) & Policies (how to use the mechanisms)
- Scaling solutions
  - asynchronous communication, decreased messaging (e.g., forms)
  - caching (all sorts of hierarchical memories: data is closer to the user → no wait / assumes rather stable data!)
  - distribution i.e. partitioning of tasks or information (domains) (e.g., DNS)
Challenges for Security

- **Security**: confidentiality, integrity, availability

- **Vulnerable components** (Fig. 2.14)
  - channels (links <-> end-to-end paths)
  - processes (clients, servers, outsiders)

- **Threats**
  - information leakage
  - integrity violation
  - denial of service
  - illegitimate usage

Current issues:
- denial-of-service attacks, security of mobile code, information flow;
- open wireless ad-hoc environments
Threats

Threats to channels (Fig. 2.14)
- eavesdropping (data, traffic)
- tampering, replaying
- masquerading
- denial of service

Threats to processes (Fig. 2.13)
- server: client’s identity; client: server’s identity
- unauthorized access (insecure access model)
- unauthorized information flow (insecure flow model)
Defeating Security Threats

- **Techniques**
  - cryptography
  - authentication
  - access control techniques
    - intranet: firewalls
    - services, objects: access control lists, capabilities

- **Policies**
  - access control models
  - lattice models
  - information flow models

- Leads to: secure channels, secure processes, controlled access, controlled flows
Environment challenges

- A distributed system:
  - HW / SW components in different nodes
  - components communicate (using messages)
  - components coordinate actions (using messages)

- Distances between nodes vary
  - in time: from msecs to weeks
  - in space: from mm’s to Mm’s
  - in dependability

- Autonomous independent actors (=> even independent failures!)

No global clock
Global state information not possible
Challenges: Design Requirements

- Performance issues
  - responsiveness
  - throughput
  - load sharing, load balancing
  - issue: algorithm vs. behavior

- Quality of service
  - correctness (in nondeterministic environments)
  - reliability, availability, fault tolerance
  - security
  - performance
  - adaptability
Where is the borderline between a computer and distributed system?
Hardware Concepts

- Characteristics which affect the behavior of software systems

- The platform ....
  - the individual nodes ("computer", "processor")
  - communication between two nodes
  - organization of the system (network of nodes)

- ... and its characteristics
  - capacity of nodes
  - capacity (throughput, delay) of communication links
  - reliability of communication (and of the nodes)

→ Which ways to distribute an application are feasible
Basic Organizations of a Node

1.6 Different basic organizations and memories in distributed computer systems

Kangasharju: Distributed Systems

October 23, 08
Multiprocessors (1)

1.7  A bus-based multiprocessor.

Essential characteristics for software design
• fast and reliable communication (shared memory)
  => cooperation at "instruction level" possible
• bottleneck: memory (especially the "hot spots")
1.8

a) A crossbar switch  
b) An omega switching network

A possible bottleneck: the switch
Homogeneous Multicomputer Systems

(a) Grid

(b) Hypercube

A new design aspect: locality at the network level
General Multicomputer Systems

- Hardware: see Ch1 (internet etc.)
- Loosely connected systems
  - nodes: autonomous
  - communication: slow and vulnerable
  - => cooperation at "service level"
- Application architectures
  - multiprocessor systems: parallel computation
  - multicomputer systems: distributed systems
  - (how are parallel, concurrent, and distributed systems different?)
# Software Concepts

<table>
<thead>
<tr>

DOS: Distributed OS; NOS: Network OS
History of distributed systems

- RPC by Birel & Nelson -84
- Network operating systems, distributed operating systems, distributed computing environments in mid-1990; middleware referred to relational databases
- Distributed operating systems – "single computer"
  - Distributed process management
    - process lifecycle, inter-process communication, RPC, messaging
  - Distributed resource management
    - resource reservation and locking, deadlock detection
- Distributed services
  - distributed file systems, distributed memory, hierarchical global naming
History of distributed systems

- late 1990’s distribution middleware well-known
  - generic, with distributed services
  - supports standard transport protocols and provides standard API
  - available for multiple hardware, protocol stacks, operating systems
  - e.g., DCE, COM, CORBA
- present middlewares for
  - multimedia, realtime computing, telecom
  - ecommerce, adaptive / ubiquitous systems
Misconceptions tackled

- The network is reliable
- The network is secure
- The network is homogeneous
- The topology does not change
- Latency is zero
- Bandwith is infinite
- Transport cost is zero
- There is one administrator
- There is inherent, shared knowledge
Multicomputer Operating Systems (1)

General structure of a multicomputer operating system

Network

October 23, 08
Network Operating System (2)

Two clients and a server in a network operating system.

Disks on which shared file system is stored
Different clients may mount the servers in different places.
Software Layers

- Platform: computer & operating system & ..

- Middleware:
  - mask heterogeneity of lower levels
  - (at least: provide a homogeneous “platform”)
  - mask separation of platform components
    - implement communication
    - implement sharing of resources

- Applications: e-mail, www-browsers, …
Positioning Middleware

General structure of a distributed system as middleware.
Middleware

- Operations offered by middleware
  - RMI, group communication, notification, replication, … (Sun RPC, CORBA, Java RMI, Microsoft DCOM, ...)

- Services offered by middleware
  - naming, security, transactions, persistent storage, …

- Limitations
  - ignorance of special application-level requirements

End-to-end argument:
- Communication of application-level peers at both ends is required for reliability
Middleware

Middleware is a class of software technologies designed to help manage the complexity and heterogeneity inherent in distributed systems. It is defined as a layer of software above the operating system but below the application program that provides a common programming abstraction across a distributed system.

Bakken 2001: Encyclopedia entry
In an open middleware-based distributed system, the protocols used by each middleware layer should be the same, as well as the interfaces they offer to applications.

Kangasharju: Distributed Systems
More examples on distributed software architectures
Architectural Models

- Architectural models provide a high-level view of the distribution of functionality between system components and the interaction relationships between them.

- Architectural models define
  - components (logical components deployed at physical nodes)
  - communication

- Criteria
  - performance
  - reliability
  - scalability, ..
Client-Server

- Client-server model: CoDoKi, Fig. 2.2
- Service provided by multiple servers: Fig. 2.3
- Needed:
  - name service
  - trading/broker service
  - browsing service
- Proxy servers and caches, Fig. 2.4

**Figure 2.2 Clients invoke individual servers** CoDoKi, Fig. 2.2

**Figure 2.3 A service provided by multiple servers** CoDoKi, Fig. 2.3

**Figure 2.4 Web proxy server** Kangasharju: Distributed Systems
An Example Client and Server (1)

The `header.h` file used by the client and server.

```c
/* Definitions needed by clients and servers. */
#define TRUE 1
#define MAX_PATH 255 /* maximum length of file name */
#define BUF_SIZE 1024 /* how much data to transfer at once */
#define FILE_SERVER 243 /* file server's network address */

/* Definitions of the allowed operations */
#define CREATE 1 /* create a new file */
#define READ 2 /* read data from a file and return it */
#define WRITE 3 /* write data to a file */
#define DELETE 4 /* delete an existing file */

/* Error codes. */
#define OK 0 /* operation performed correctly */
#define E_BAD_OPCODE -1 /* unknown operation requested */
#define E_BAD_PARAM -2 /* error in a parameter */
#define E_IO -3 /* disk error or other I/O error */

/* Definition of the message format. */
struct message {
    long source; /* sender's identity */
    long dest; /* receiver's identity */
    long opcode; /* requested operation */
    long count; /* number of bytes to transfer */
    long offset; /* position in file to start I/O */
    long result; /* result of the operation */
    char name[MAX_PATH]; /* name of file being operated on */
    char data[BUF_SIZE]; /* data to be read or written */
};
```
An Example Client and Server (2)

```c
#include <header.h>
void main(void) {
    struct message ml, m2; /* incoming and outgoing messages */
    int r; /* result code */

    while(TRUE) { /* server runs forever */
        receive(FILE_SERVER, &ml); /* block waiting for a message */
        switch(ml.opcode) { /* dispatch on type of request */
            case CREATE: r = do_create(&ml, &m2); break;
            case READ: r = do_read(&ml, &m2); break;
            case WRITE: r = do_write(&ml, &m2); break;
            case DELETE: r = do_delete(&ml, &m2); break;
            default: r = E_BAD_OPCODE;
        }
        m2.result = r; /* return result to client */
        send(ml.source, &m2); /* send reply */
    }
}
```

A sample server.
A client using the server to copy a file.
The general organization of an Internet search engine into three different layers:

1. **User-interface level**
   - User interface
   - HTML page containing list

2. **Processing level**
   - Query generator
   - HTML generator
   - Ranking component
   - Ranked list of page titles

3. **Data level**
   - Database queries
   - Database with Web pages
   - Web page titles with meta-information
Alternative client-server organizations.
Multitiered Architectures (2)

Client - server: generalizations

A client: node 1
server: node 2

B client: node 2
server: node 3

the concept is related to communication not to nodes
An example of a server acting as a client.
Variations on the Client-Server model

- Mobile code
  - the service is provided using a procedure
  - executed by a process in the server node
  - downloaded to the client and executed locally Fig. 2.6
  - push service: the initiator is the server

- Mobile agents
  - “a running program” (code & data) travels
  - needed: an agent platform

Figure 2.6  Web applets
Variations on the Client-Server model (cont.)

- Network computers
  - “diskless workstations”
  - needed code and data downloaded for execution

- Thin clients
  - “PC”: user interface
  - server: execution of computations (Fig. 2.7)
  - example: Unix X-11 window system

![Diagram of Network computer or PC, Thin Client, network, Compute server, Application Process]

Figure 2.7 Thin clients and compute servers  CoDoKi, Fig. 2.7
Variations on the Client-Server model (cont.)

- Mobile devices and spontaneous networks, ad hoc networks (Fig. 2.8)
- Needed
  - easy connection to a local network
  - easy integration with local services
- Problems
  - limited connectivity
  - security and privacy
- Discovery service
  - two interfaces: registration, lookup

Figure 2.8  Spontaneous networking in a hotel
An example of horizontal distribution of a Web service.
Other Architectures

■ Andrews paradigms:
  filter: a generalization of producers and consumers

 ■ Peer to peer

CoDoKi, Fig. 2.5
Chapter Summary

- Introduction into distributed systems
- Challenges and goals of distributing
- Examples of distributed systems
