- Platforms
- Comparison
- Outlook
Middleware

- Widely used and popular term
- Fuzzy term
- One definition
  - “A set of service elements above the operating system and the communications stack”
- Second definition
  - “Software that provides a programming model above the basic building blocks of processes and message passing” (Colouris, Dollimore, Kindberg, 2001)
Why Middleware?

- Application development is complex and time-consuming
  - Should every developer code their own protocols for directories, transactions, ..?
  - How to cope with heterogeneous environments?
    - Networks, operating systems, hardware, programming languages

- Middleware is needed
  - To cut down development time
    - Rapid application development
  - Simplify the development of applications
  - Support heterogeneous environments and mask differences in OS/languages/hardware
Middleware cont.

- Middleware services include
  - directory, trading, brokering
  - remote invocation (RPC) facilities
  - transactions
  - persistent repositories
  - location and failure transparency
  - messaging and events
  - Security
  - synchronization

- Network stack (transport and below) is not part of middleware
Middleware provides various transparencies (HW, OS, location, fault, ..) for apps.

APIs for: RPC, messaging, transactions, session management, storage, directories, trading, etc.

Underlying network (link layer, physical)
The Hourglass

- Diverse applications
- Convergence
- Transport layer (TCP/IP)
- Divergence
- Diverse physical layers
Mobile Platforms

- Collections of central services and libraries with both reactive and proactive functions

- APIs typically logically centralized

- Distributed between elements of the environment
  - Multi-tier client-server
  - Peer-to-peer
  - Hybrids

- The platform running on the mobile terminal and the characteristics of the device determine how service is rendered for the end user
Wireless and Cloud

- Wireless hop is the limiting factor
  - Bandwidth, connectivity, reachability, tail energy, costs

- Server side scalability can be achieved by using traditional solutions:
  - clusters, caching, geographical distribution, load balancing, data centers

- Cloud computing
  - Integration, offloading
  - Web apps vs. native apps
Mobile Service Development

- The mobile landscape is fragmented
  - Heterogeneous device base
  - Many different wireless technologies

- The situation is challenging for the developer
  - Many APIs
    - Open vs. private APIs
  - Many middleware platforms
  - APIs evolve over time

- Current challenge of the industry pertains to improving the development processes
Introduction to Platforms

- Mobile middleware aims to support the development, deployment, and execution of distributed applications in the heterogeneous and dynamic mobile environment.
- The goals for mobile middleware include adaptability support, fault-tolerance, heterogeneity, scalability, and context-awareness.
- The industry solution to these challenges has been to create middleware platforms.
- A platform collects frequently used services and APIs under a coherent unified framework.
Platforms

2009
- Java Micro Edition (Java ME)
- iOS
- Symbian and Series 60
- Windows Mobile
- Linux Maemo (MeeGo)
- Android
- BREW
- WAP

2012
- iOS
- Android
- Windows Phone 7
- HTML5 web apps
Application Trends

- WP7
  - Native apps, cloud integration

- iOS
  - Native apps, cloud integration
  - Potential for Web apps

- Android
  - Native apps, cloud integration

- WebOS
  - Web apps with HTML5
  - Obsolete (open source)

- Blackberry
  - Native and Web apps
Challenges

- **Fragmentation is a major problem**
  - device-level fragmentation
  - standard fragmentation
  - implementation fragmentation

- **Energy consumption**
  - Modelling: where is the energy going
  - Optimization: how to improve things

- **Security is also a problem**
  - Sandboxed environments and privileged operations require certification
  - Certification is difficult for developers
  - Current trend is towards application stores and more lightweight certification processes
  - No malware for iOS, plenty for Android
Update problems

- WP7 and Android updates not available for all devices
- Microsoft update development process
  - OEMs work with Microsoft to customize the update with their handset firmwares
  - The carriers (who also have code on the OEM phones) check these updates
  - Same as with Android, Google tightening control.
- Recent problems: phones bricked (out of battery when updating)
- Older problems: excessive background data transfer, update problems
Examples

- Classical examples
  - WAP
  - Java ME
  - Symbian
  - MAEMO / MeeGo

- Current Platforms
  - Windows Phone 7
  - iPhone
  - Android
  - Web apps
Wireless Application Environment (WAE)
- A suite of protocols and specifications for optimizing data transfer for wireless communication

WAP stack
- Focus on binary transmission
- WSP (Wireless Session Protocol)
  - HTTP replacement, “compressed”
- WTP (Wireless Transaction Protocol)
  - Request/response, more efficient than TCP
- WTLS (Wireless Transport Layer Security)
  - Based on TLS, may not be end-to-end with a gateway
- WDP (Wireless Datagram Protocol)
  - UDP replacement
Web Access with Gateway

Client

Web Browser

encoded request

wireless

encoded response

Gateway

Encoders

Decoders

Protocol Gateways

request

response

Server

HTTP Server

CGI,..
Web Access

- Data transformation
  - WAP gateway performs data transformation between WML (or XHTML) and HTML

- Data compression
  - Technique are used for dealing with images and other graphics

- Adaptability
  - User profile and device characteristics are stored in the WAP gateway

- Security
  - Secure Enterprise Proxy (SEP) using 128-bit encryption in WAP 1.2

- Service discovery and mobility support
  - WAP’s “walled garden” – WAP gateways are provided by ISP such as AOL
WAE: current status

- WAP Forum now in OMA (Open Mobile Alliance)
- WAP 2.0, is a re-engineering of WAP using a cut-down version of XHTML with end-to-end HTTP
- Gateway and custom protocol suite is optional.
- WAP used by many handsets
  - 1.2 version introduced WAP Push (typically using an SMS message)
- Typically versatile networking stacks with also IPv6 support
Java Micro Edition (Java ME)

- Java for consumer electronics and embedded devices
- A virtual machine and a set of APIs
- Configurations and profiles
  - Configurations
    - two-low level APIs and optimized VMs
      - CDC, CLDC
  - Profiles
    - API specification on top of a configuration for complete runtime
    - CLDC: MIDP
    - CDC: Foundation, Personal Basis, Personal
    - Profiles defined using Java Community Process (JCP)
Java Editions

- Java Card, which allows small Java-based applications to be executed on smart cards
- Java ME (Micro Edition, formerly J2ME), which specifies several different profiles, collections of libraries
  - for devices that are sufficiently limited that it is not feasible to support the full Java platform on them.
- Java SE (Standard Edition), which is the platform for general purpose desktop PCs.
- Java EE (Enterprise Edition), which includes the Java SE and a number of additional
  - APIs for multi-tier client-server enterprise applications.
Servers & enterprise computers

Optional Packages

Java 2 Platform, Enterprise Edition (J2EE)

JVM™

Servers & personal computers

Optional Packages

Java 2 Platform, Standard Edition (J2SE)

JVM

High-end PDAs

TV set-top boxes

Embedded devices

Optional Packages

Personal Profile

Personal Basis Profile

Foundation Profile

MIDP

CDC

CLDC

KVM

Mobile phones & entry-level PDAs

Optional Packages

Java Card

Card VM

Smart cards

Java Platform, Micro edition (Java ME)
Important JSRs

- 75 File Connection and PIM
- 82 Bluetooth
- 120 Wireless Messaging API (WMA)
- 135 Mobile Media API (MMAPI) Audio, video, multimedia
- 172 Web Services
- 177 Security and Trust Services
- 179 Location API
- 180 SIP API
- 184 Mobile 3D Graphics
- 185 Java Technology for the Wireless Industry (JTWI) General
- 205 Wireless Messaging 2.0 (WMA)
- 211 Content Handler API
- 226 SVG 1.0
- 229 Payment API
- 234 Advanced Multimedia Supplements (AMMS) MMAPI extensions
- 238 Mobile Internationalization API
- 239 Java Bindings for the OpenGL ES API
- 248 Mobile Service Architecture General
  - Collects useful specifications
- 256 Mobile Sensor API
- 287 SVG 2.0
MIDP 3.0

- MIDP 3 specified in JSR 271 will specify the 3rd generation mobile APIs.
  - AMS (Application Management System)
  - Multitasking
  - Provisioning and OTA
  - Shared libraries
  - Security and access control
  - Service framework
  - Inter-MIDlet communication
  - User Interface improvements

- A key design goal of MIDP3 is backward compatibility with MIDP2 content

- Approved in Dec, 2009. Not supported by current phones.
CDC Technology

- Connected Device Configuration (CDC); JSR 36, JSR 218
- Foundation Profile, (FP); JSR 46, JSR 218
- Personal Basis Profile, (PBP); JSR 129, JSR 217
- Personal Profile, (PP); JSR 62, JSR 216
- J2ME RMI Optional Package, (RMI OP); JSR 66
- JDBC Optional Package for CDC/Foundation Profile API; JSR 169
- Java TV API; JSR 927
- Java Secure Socket Extension for Connected Device Configuration (JSSE)
APIs

- Mobile Sensor API, Contactless Communication API, and Location API
- The Mobile Broadcast Service API supports the delivery of streaming multimedia to mobile phones
- Converged communications support is provided by the XML API and IP Multimedia Subsystem (IMS) Services API
- The Mobile User Interface Customization API and Scalable 2D Vector Graphics API
## Summary

<table>
<thead>
