58093 String Processing Algorithms (Autumn 2015)
Exercises 7 (Tuesday, December 8)

1. Let $T =$ `lallilla$`.

    (a) Give the suffix tree of T including suffix links.

    (b) Give the suffix array of T together with the LCP array.

2. The reverse of a string $S[0..m)$ is the string $S^R = S[m-1]S[m-2]..S[0]$. Describe an algorithm for finding the longest factor S of T such that the reverse S^R is a factor of T too. The algorithm should work in linear time on a constant alphabet.

3. What is the number of distinct factors in the string `abracadabra`?

4. Give a linear time algorithm for computing the matching statistics of S with respect to T from the generalized suffix *array* of S and T and the associated LCP array (without constructing the suffix tree).

5. Let $L =$ `rttrraa$ii` be the Burrows–Wheeler transform of a text T.

    (a) What is T?

    (b) Simulate backward search on T for the pattern $P =$ `ari`.
